

## **Professor Raveesha KH, Head of Department of Physics, CMR Institute of Technology**

Professor Raveesha loves to interact with his students to find out what could be the latest inventions in tech. He suggests that mobile phones could be upgraded even more. “My tech wishlist would be a mobile phone with a telescope,” he says. “The common man would be able to take photographs of the moon and see what is on its surface. It would be beneficial for students interested in astronomy and the defence sector. I think Apple would design such a phone in the near future.”

Addressing the universal problem of charging mobile phones while on-the-go, Professor Raveesha says, “I also wish for long-charging mobile phone batteries that will last for a month. Long-lasting batteries will not only be convenient for the common man, but would also be of use to space engineers.”

### **What's out there?**

There are laptops that run on solar energy. It needs to become more popular and I am sure it will soon!
