

# Internal Test II, April 2018

Sub: System Software & Compiler Design

Subcode: 15CS63, Prepared by:

Sagarika Behera  
Dept. of CSE

① A syntax-directed Definition (SDD) is a context free grammar, together with attributes & rules. (1M)

SDD for desk calculator (4M)

## Production

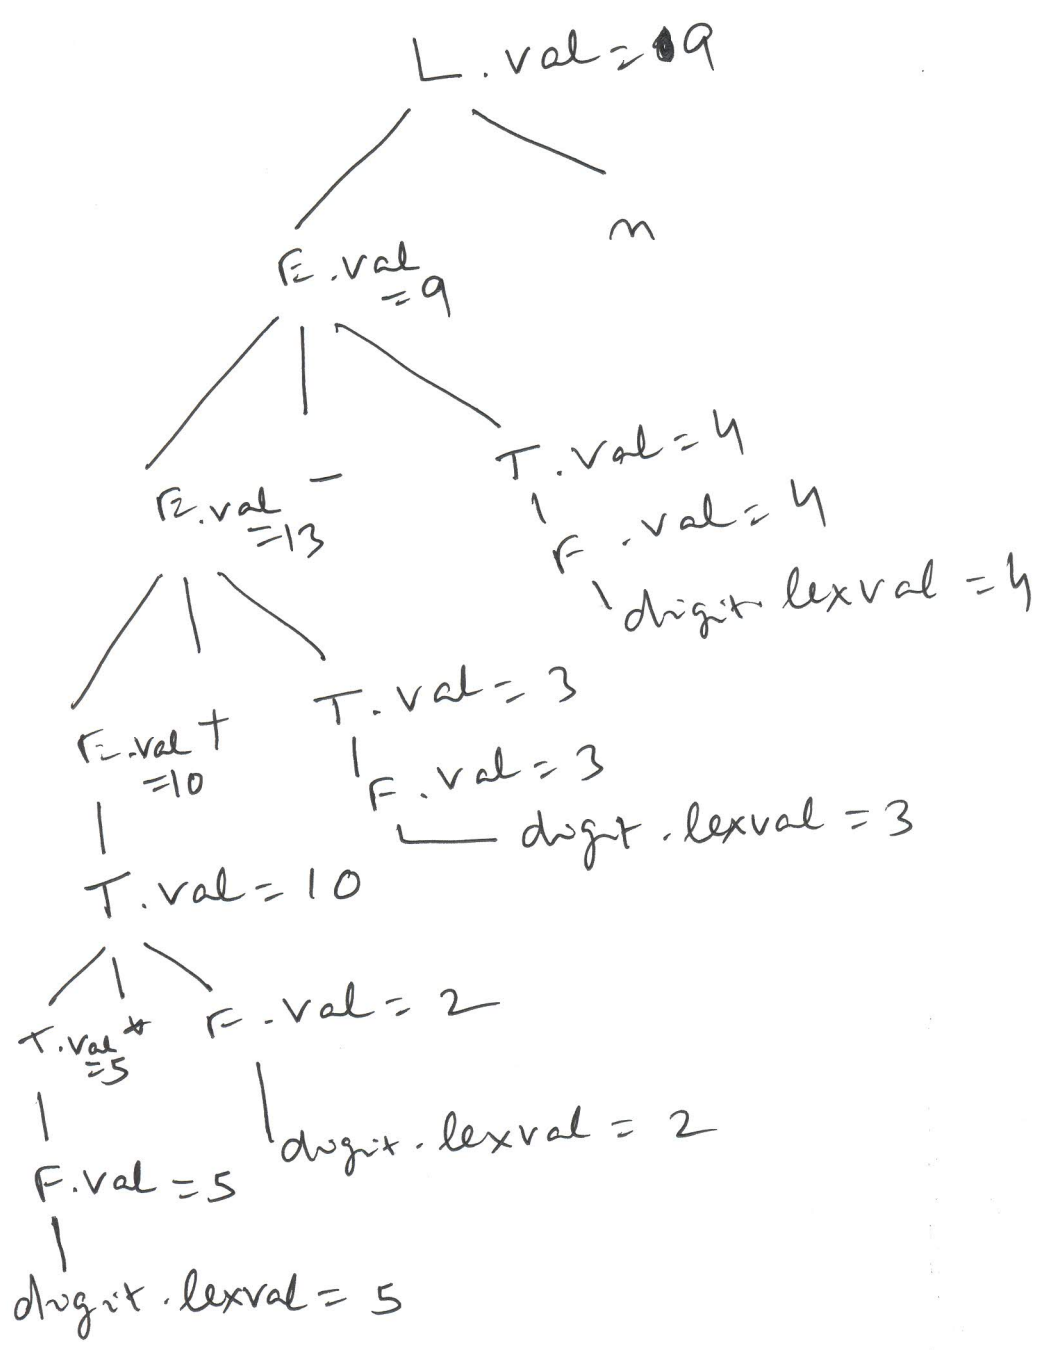

- 1)  $L \rightarrow E^n$
- 2)  $E \rightarrow E_1 + T$
- 3)  $E \rightarrow T$
- 4)  $T \rightarrow T_1 * F$
- 5)  $T \rightarrow F$
- 6)  $F \rightarrow (E)$
- 7)  $F \rightarrow \text{digit}$

## Semantic Rules

- $L.\text{val} = E.\text{val}$
- $E.\text{val} = E_1.\text{val} + T.\text{val}$
- $E.\text{val} = T.\text{val}$
- $T.\text{val} = T_1.\text{val} * F.\text{val}$
- $T.\text{val} = F.\text{val}$
- $F.\text{val} = E.\text{val}$
- $F.\text{val} = \text{digit}.\text{lexval}$

# Annotated parse tree for $5 * 2 + 3 - 4$

(5M)

2.(a) Synthesized attribute [2x2.5]

A synthesized attribute at node  $n$  is defined only in terms of attribute values at the children of  $n$  &  $n$  itself.

Ex  $E \rightarrow E + T$   $E.val = E.val + T.val$

Inherited attribute

Inherited attribute for a nonterminal  $B$  at a parse tree node  $n$  is defined by  $a$

Semantic rule associated with the production at the parent of  $n$ . An inherited attribute at node  $n$  is defined only in terms of attribute values at  $n$ 's parent,  $n$  itself and  $n$ 's siblings.

Ex  $E \rightarrow TE'$   $E'.inh = T.val$

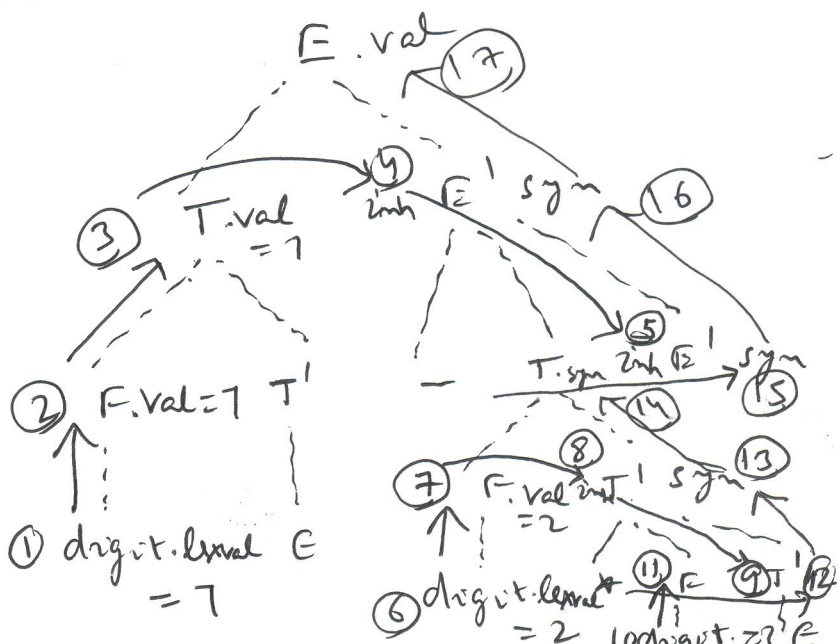

2.(b)  $a + a * (a + (b - c)) + d * (a + a)$

[5M]

3.(a) After removing left recursion [5+2]

$$\begin{aligned}
 E &\rightarrow TE' \\
 E' &\rightarrow -TE' \mid E \\
 T &\rightarrow FT' \\
 T' &\rightarrow *FT' \mid E \\
 F &\rightarrow \text{digit}
 \end{aligned}$$

- 1 2 3 4 5 6 7 8 9 10
- 11 12 13 14 15 16 17

### 3.(b) Need of Intermediate Code generation

[2]

→ In the analysis-synthesis model of a computer, the front end analyzes a source program & creates an intermediate representation, from which the back end generates target code.

→ If there is no intermediate form, then for  $m$  source language &  $n$  target machine, it requires  $m \times n$  translations.

But with intermediate form it requires  $m+n$  translations.

[4+6]

### 4. Productions

#### Semantic Rules

$$E \rightarrow E + T$$

$$E.\text{node} = \text{new Node}('+', E.\text{node}, T.\text{node})$$

$$E \rightarrow E - T$$

$$E.\text{node} = \text{new Node}('-', E.\text{node}, T.\text{node})$$

$$E \rightarrow T$$

$$E.\text{node} = T.\text{node}$$

$$T \rightarrow T * F$$

$$T.\text{node} = \text{new Node}('*', T.\text{node}, F.\text{node})$$

$$T \rightarrow T / F$$

$$T.\text{node} = \text{new Node}('/', T.\text{node}, F.\text{node})$$

$$T \rightarrow F$$

$$T.\text{node} = F.\text{node}$$

$$F \rightarrow (E)$$

$$F.\text{node} = E.\text{node}$$

$$F \rightarrow \text{digit}$$

$$F.\text{node} = \text{new Leaf}(\text{digit}, \text{value})$$

steps to construct tree for  $a + 5 * d - 6$

$P_1 = \text{new leaf}(\text{digit}, 5)$

$P_2 = \text{new leaf}(\text{id}, \text{entry for } d)$

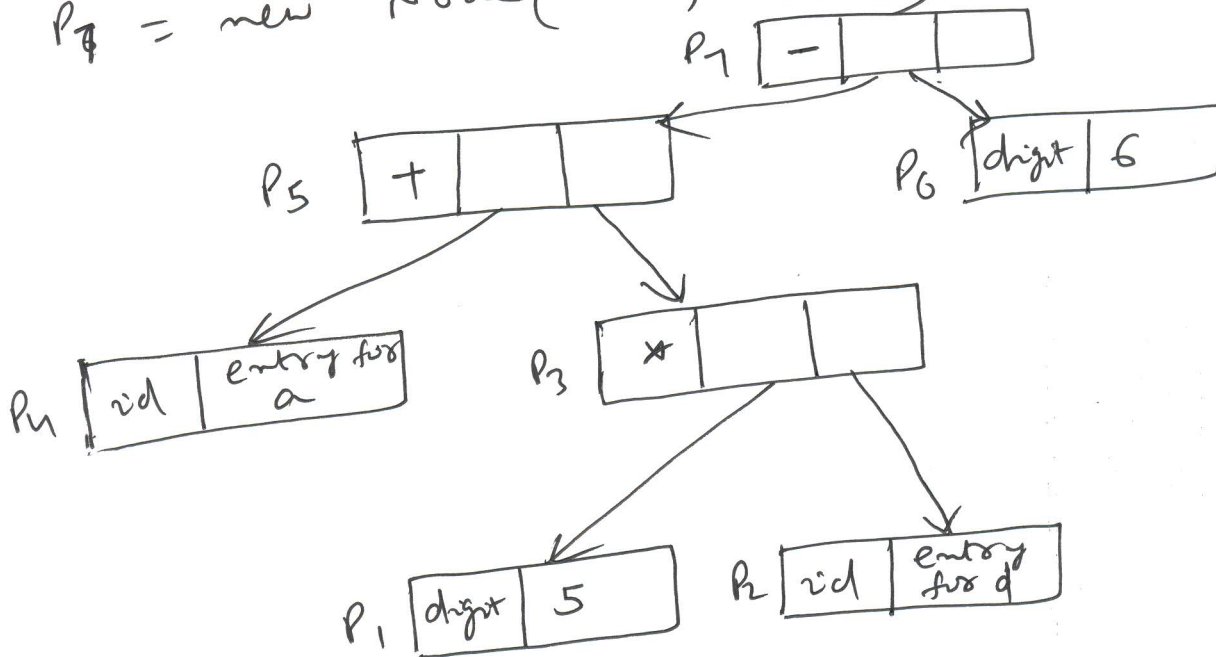

$P_3 = \text{new node}('*', P_1, P_2)$

$P_4 = \text{new leaf}(\text{id}, \text{entry for } a)$

$P_5 = \text{new node}('+', P_4, P_3)$

$P_6 = \text{new leaf}(\text{digit}, 6)$

$P_7 = \text{new node}('-', P_5, P_6)$

5. (a) Different ways of representing Intermediate form

---

- ① 3-address code
- ② Dissected Acyclic Graph (DAG)
- ③ Postfix Notation or Polish Notation

3-add code

$$(a-b) * (c+d) - (a+b)$$

[2x3]

$$t_1 = a - b$$

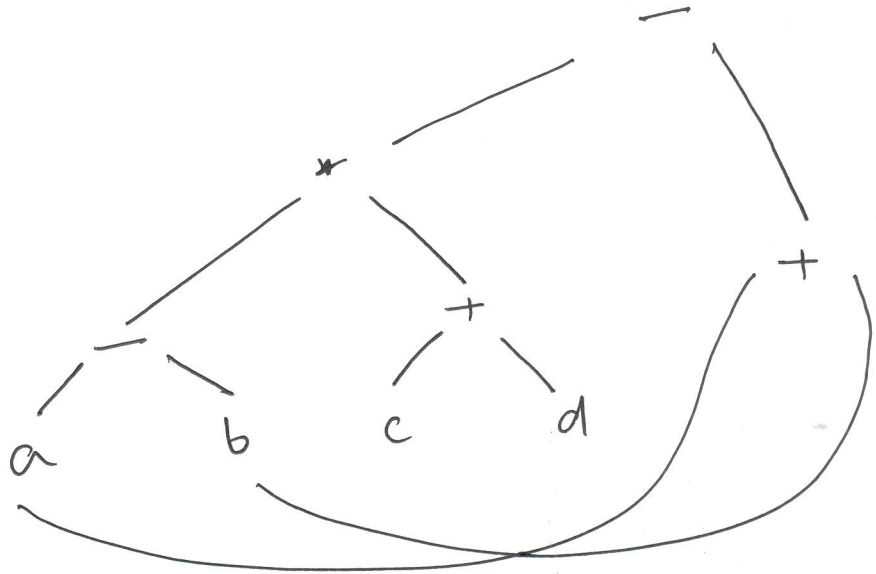

$$t_2 = c + d$$

$$t_3 = a + b$$

$$t_4 = t_1 * t_2$$

$$t_5 = t_4 - t_3$$

DAG

Postfix or Polish notation

ab - cd + \* ab + -

(b) switch (expression)

[04]

{

case v1: s1; break;

case v2: s2; break;

⋮

case v<sub>m-1</sub>: s<sub>m-1</sub>; break;

} default: s<sub>m</sub>;

### 3-add code for switch statement

Code to evaluate E into t

goto test

L<sub>1</sub>: code for S<sub>1</sub>  
goto next

L<sub>2</sub>: code for S<sub>2</sub>  
goto next:

...

L<sub>m-1</sub>: code for S<sub>m-1</sub>  
goto next

L<sub>m</sub>: code for S<sub>m</sub>  
goto next

test: if t = V<sub>1</sub> goto L<sub>1</sub>  
if t = V<sub>2</sub> goto L<sub>2</sub>

...

if t = V<sub>m-1</sub> goto L<sub>m-1</sub>  
goto L<sub>m</sub>

next:

6. Intermediate code for [10]

for i=1 to 10 do

for j=1 to 10 do

A[i,j] = 0.0

for i=1 to 10 do

A[i,i] = 1.0

1)  $i = 1$

2)  $j = 1$

3)  $t_1 = 10 * i$

4)  $t_2 = t_1 + j$

5)  $t_3 = 8 * t_2$

6)  $t_4 = t_3 - 88$

7)  $a[t_4] = 0.0$

8)  $j = j + 1$

9) if  $j <= 10$  goto (3)

10)  $i = i + 1$

11) if  $i < 10$  goto (2)

12)  $i = 1$

13)  $t_5 = i - 1$

14)  $t_6 = 88 * t_5$

15)  $a[t_6] = 1.0$

16)  $i = i + 1$

17) if  $i <= 10$  goto (13)

7. (a) 3-add code for  $a + (b - c * d) / e$

[2 x 3]

Q

$t_1 = c * d$

$t_2 = b - t_1$

$t_3 = t_2 / e$

$t_4 = a + t_3$

## Quadruples

Index	Operator	Operand 1	Operand 2	Result
0	*	c	d	t <sub>1</sub>
1	-	b	t <sub>1</sub>	t <sub>2</sub>
2	/	t <sub>2</sub>	e	t <sub>3</sub>
3	+	a	t <sub>3</sub>	t <sub>4</sub>

## Triples

Index	Operator	Operand 1	Operand 2
0	*	c	d
1	-	b	[0]
2	/	[1]	e
3	+	a	[2]

## Indirect Triples

Triples table + Index table

Index table

Index	Operator	Opnd 1	Opnd 2
0	*	c	d
1	-	b	[0]
2	/	[1]	e
3	+	a	[2]

Index	Pointer
100	[0]
101	[1]
102	[2]
103	[3]

7.(b) 3-add code for the expression

$\text{if } (a > b \text{ || } b < 10 \ \&\& \ c > 2) \ x = 1$

3-add code

[4M]

$\text{if } b < 10 \ \text{goto } L_1$

$\text{goto } L_3$

$L_1: \text{if } c > 2 \ \text{goto } L_2$

$\text{goto } L_3$

$L_2: \ x = 1$

$\text{goto } \text{last}$

$L_3: \text{if } a > b \ \text{goto } L_2$

$\text{last:}$
