The code is centered around procedures.	Focus is on data. Code is centered around data.	3	Procedures are dissociated from data and are not part of it.	Procedures are bound to the data.	4	Data is not secure. Compilers that implement the procedure-oriented programming system do not prevent unauthorized functions from accessing/manipulating structure variables.	Enables data security by throwing compile time errors against piece of code that violate the prohibition.	5	Data is not initialized	Provides guaranteed initialization of data. Programmers can ensure a guaranteed initialization of data members of structure variables to the desired values.	6.	Overloading is not supported	Supports overloading of operators and functions			
#	Procedure Oriented Programming	Object Oriented Programming																									
1	Program is divided into small parts called functions	Program is divided into parts called objects																									
2	Focus is on procedures. The code is centered around procedures.	Focus is on data. Code is centered around data.																									
3	Procedures are dissociated from data and are not part of it.	Procedures are bound to the data.																									
4	Data is not secure. Compilers that implement the procedure-oriented programming system do not prevent unauthorized functions from accessing/manipulating structure variables.	Enables data security by throwing compile time errors against piece of code that violate the prohibition.																									
5	Data is not initialized	Provides guaranteed initialization of data. Programmers can ensure a guaranteed initialization of data members of structure variables to the desired values.																									
6.	Overloading is not supported	Supports overloading of operators and functions																									

		<pre> example program in C++. #include &lt;iostream&gt; using namespace std;  int main() {      int first_number, second_number, sum;      cout &lt;&lt; "Enter two integers: ";     cin &gt;&gt; first_number &gt;&gt; second_number;      // sum of two numbers in stored in variable sumOfTwoNumbers     sum = first_number + second_number;      // prints sum     cout &lt;&lt; first_number &lt;&lt; " + " &lt;&lt; second_number &lt;&lt; " = " &lt;&lt; sum;      return 0; } </pre>			
<b>Question</b>	1b	<p>Explain how one can bridge two classes using friend Function. Write a C++ program to find largest among two numbers using friend Function. Assume two variables are present in two different class.</p>	5	CO2	L3
<b>Scheme</b>		<p>Explanation (1M) Program (4M)</p>	1+4		
<b>Solution</b>		<p>Friend function can be used as bridge between two classes. To bridge two classes with a function, the function should be declared as a friend to both the classes. Then the friend function can access private data of both the classes.</p> <pre> #include &lt;iostream&gt; using namespace std;  class B ; // Forward declaration  //void largest (A, B);  class A {     private:         int a;      public:         A()         {             a = 100;         } } </pre>			

	<pre> friend void largest(A,B); };  class B { private: int b; public: B() { b = 200; } friend void largest(A,B); };  void largest (A Aobj, B Bobj) {  if(Aobj.a &gt; Bobj.b) cout &lt;&lt; "largest of private members of class A and B = " &lt;&lt; Aobj.a );  else cout &lt;&lt; "largest of private members of class A and B = " &lt;&lt; Bobj.b); }  int main() { A A1; B B1; largest (A1, B1); return 0; } </pre>				
<b>Question</b>	2a	Explain the use of scope resolution operator with an example program.	5	CO1	L2
<b>Scheme</b>		Explanation/Justification (2M) Program (3M)	2+3		
<b>Solution</b>		<p>The scope resolution operator ( :: ) is used for several reasons. For example: If the global variable name is same as local variable name, the scope resolution operator will be used to call the global variable. It is also used to define a function outside the class.</p> <pre> #include&lt;iostream&gt; using namespace std;  class A { public: </pre>			

		<pre>// Only declaration void fun(); };  // Definition outside class using :: void A::fun() {     cout &lt;&lt; "fun() called"; }  int main() {     A a;     a.fun();     return 0; }</pre>			
<b>Question</b>	2b	Write a C++ program to overload the member function area() to find area of rectangle and area of triangle	5	CO2	L3
<b>Scheme</b>		Program (5M)	5		
<b>Solution</b>		<pre>#include&lt;iostream&gt; using namespace std; int area(int,int); float area(float,float); int main() {     int l,b;     float bs,ht;     cout&lt;&lt;"Enter length and breadth of rectangle:";     cin&gt;&gt;l&gt;&gt;b;     cout&lt;&lt;"Enter base and height of triangle:";     cin&gt;&gt;bs&gt;&gt;ht;     cout&lt;&lt;"\nArea of rectangle is "&lt;&lt;area(l,b);     cout&lt;&lt;"\nArea of triangle is "&lt;&lt;area(bs,ht);      return 0; } int area(int l,int b) {     return(l*b); } float area(float bs,float ht) {     return((bs*ht)/2); }</pre>			
<b>Question</b>	3a	Write a C++ program using static data member to count the number of objects created.	5	CO2	L3
<b>Scheme</b>		Program (5M)	5		
<b>Solution</b>		<pre># include&lt;iostream&gt; using namespace std; class A {     int code;     static int count;</pre>			

```

public:
A ()
{
count++;
}
void showcount(void)
{
cout << "The number of objects created is " << count << endl;
}
};
int A :: count;
int main()
{
A obj1, obj2, obj3,obj4;
obj1.showcount();
}

```

<b>Question</b>	3b	Differentiate between parameterized constructor and copy constructor.	5	CO1	L2
-----------------	----	---	---	-----	----

<b>Scheme</b>	Difference- 4 points (2M) 1 Example program for each (3M)	2+3			
---------------	--	-----	--	--	--

<b>Solution</b>	<table border="1"> <thead> <tr> <th>#</th> <th>Parameterized Constructor</th> <th>Copy Constructor</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>A Parameterized constructor is a member function that is used to initialize the various data elements of different objects with different values when they are created.</td> <td>A copy constructor is a member function which initializes an object using another object of the same class.</td> </tr> <tr> <td>2</td> <td>It is useful when we want to provide different values to the objects.</td> <td>It is helpful when we want to copy a complex object that has several fields, or when we want to make a deep copy of an existing object.</td> </tr> <tr> <td>3</td> <td>It carries a regular variable parameter in its prototype.</td> <td>It carries an object parameter in its prototype. In copy constructor we need to use reference of object.</td> </tr> <tr> <td>4</td> <td><b>Syntax:</b> name_of_class (variables) { //Code for constructor }</td> <td><b>Syntax:</b> Class_name(const class_name &amp;object_name) { // body of the constructor }</td> </tr> </tbody> </table>	#	Parameterized Constructor	Copy Constructor	1	A Parameterized constructor is a member function that is used to initialize the various data elements of different objects with different values when they are created.	A copy constructor is a member function which initializes an object using another object of the same class.	2	It is useful when we want to provide different values to the objects.	It is helpful when we want to copy a complex object that has several fields, or when we want to make a deep copy of an existing object.	3	It carries a regular variable parameter in its prototype.	It carries an object parameter in its prototype. In copy constructor we need to use reference of object.	4	<b>Syntax:</b> name_of_class (variables) { //Code for constructor }	<b>Syntax:</b> Class_name(const class_name &object_name) { // body of the constructor }				
	#	Parameterized Constructor	Copy Constructor																	
1	A Parameterized constructor is a member function that is used to initialize the various data elements of different objects with different values when they are created.	A copy constructor is a member function which initializes an object using another object of the same class.																		
2	It is useful when we want to provide different values to the objects.	It is helpful when we want to copy a complex object that has several fields, or when we want to make a deep copy of an existing object.																		
3	It carries a regular variable parameter in its prototype.	It carries an object parameter in its prototype. In copy constructor we need to use reference of object.																		
4	<b>Syntax:</b> name_of_class (variables) { //Code for constructor }	<b>Syntax:</b> Class_name(const class_name &object_name) { // body of the constructor }																		
	<p><u>Parametrized constructor Example Program:</u></p> <pre> #include&lt;iostream&gt; using namespace std; class A { private: int a, b; public: A(int a1, int b1) { a = a1; b = b1; } int getA() { return a; } int getB() { return b; } </pre>																			

		<pre> } }; int main() {   A obj1(10, 15);    cout &lt;&lt; "a = " &lt;&lt; obj1.getA() ;   cout &lt;&lt; ", b = " &lt;&lt; obj1.getB();    return 0; }  <u>copy constructor Example Program:</u>  int main() {   A obj1(10, 15);    cout &lt;&lt; "a = " &lt;&lt; obj1.getA() ;   cout &lt;&lt; ", b = " &lt;&lt; obj1.getB();    return 0; } void Display() {   cout&lt;&lt;"\nValues :"&lt;&lt; copy_a &lt;&lt;"\t"&lt;&lt; copy_b; } }; int main() {   copycon obj(10,20);   copycon obj2=obj; //Copy Constructor   cout&lt;&lt;"\nI am parameterized Constructor";   obj.Display();   // Constructor invoked.   cout&lt;&lt;"\nI am copy Constructor";   obj2.Display();   return 0; } </pre>			
<b>Question</b>	4a	List the rules for mentioning default arguments in a function declaration. With an example program show its usage.	5	CO1	L2
<b>Scheme</b>		List of Rules-4points (2M) Example Program showing usage (3M)	2+3		
<b>Solution</b>		Rules: <ul style="list-style-type: none"> <li>• Only the last argument must be given default value. You cannot have a default argument followed by non-default argument.</li> <li>• If you default an argument, then you will have to default all the subsequent arguments after that.</li> <li>• You can give any value a default value to argument, compatible with its datatype.</li> </ul>			

		<ul style="list-style-type: none"> <li>• <u>Example:</u></li> </ul> <pre> int mul (int i, int j=5, int k=10); //legal. int mul (int i=5, int j); //illegal. int mul (int i=0,int j, int k=10); //illegal. int mul (int i=2, int j=5, int k=10); //legal.  #include &lt;iostream&gt; using namespace std;  // A function with default arguments, // it can be called with // 2 arguments or 3 arguments or 4 arguments. int sum(int x, int y, int z = 0, int w = 0) //assigning default values to z,w as 0 {     return (x + y + z + w); } // Driver Code int main() {     // Statement 1     cout &lt;&lt; sum(10, 15) &lt;&lt; endl;      // Statement 2     cout &lt;&lt; sum(10, 15, 25) &lt;&lt; endl;      // Statement 3     cout &lt;&lt; sum(10, 15, 25, 30) &lt;&lt; endl;     return 0; } </pre>			
<b>Question</b>	4b	Write a C++ program to create a class called Employee with data members name , age and salary. Display at least 10 employee information	5	CO2	L3
<b>Scheme</b>		Program (5M)	5		
<b>Solution</b>		<pre> #include&lt;iostream&gt; using namespace std; class Employee {     private:         int age;         char name[20];         int salary;      public:         Employee()         {             salary = 1000;         }         void GetData();         void DispData(); }; </pre>			

		<pre> void Employee::GetData() {     cout&lt;&lt;"Enter the employee age: ";     cin&gt;&gt;age;     cout&lt;&lt;"Enter the employee name: ";     cin&gt;&gt;name;     cout&lt;&lt;"Enter the employee salary: ";     cin&gt;&gt;salary; } void Employee::DispData() {     cout&lt;&lt;endl&lt;&lt;age&lt;&lt;"\t"&lt;&lt;name&lt;&lt;"\t"&lt;&lt;salary&lt;&lt;"\t"; } int main() {     Employee e[10];     cout&lt;&lt;"Enter the employee information:"&lt;&lt;endl;     for(int i=0;i&lt;10;i++)     {         e[i].GetData();     }     cout&lt;&lt;endl&lt;&lt;"The employee information is:";     cout&lt;&lt;endl&lt;&lt;"EmpID \t Name \t Bsalary \t Allowance";     for(int i=0; i&lt;10;i++)     {         e[i].DispData();     } } </pre>			
<b>Question</b>	5a	Briefly discuss about JVM, JRE, JDK	5	CO1	L2
<b>Scheme</b>		Explanation of each (1.5 M) Diagram (0.5M)	4.5+0.5		
<b>Solution</b>		<p><u>JAVA VIRTUAL MACHINE</u>  JVM (Java Virtual Machine) is an abstract machine. It is called a virtual machine because it doesn't physically exist. It is a specification that provides a runtime environment in which Java bytecode can be executed. It can also run those programs which are written in other languages and compiled to Java bytecode.</p> <p>JVMs are available for many hardware and software platforms. JVM, JRE, and JDK are platform dependent because the configuration of each OS is different from each other. However, Java is platform independent. There are three notions of the JVM: specification, implementation, and instance.</p> <p>The JVM performs the following main tasks:</p> <ul style="list-style-type: none"> <li>Loads code</li> <li>Verifies code</li> <li>Executes code</li> <li>Provides runtime environment</li> </ul>			

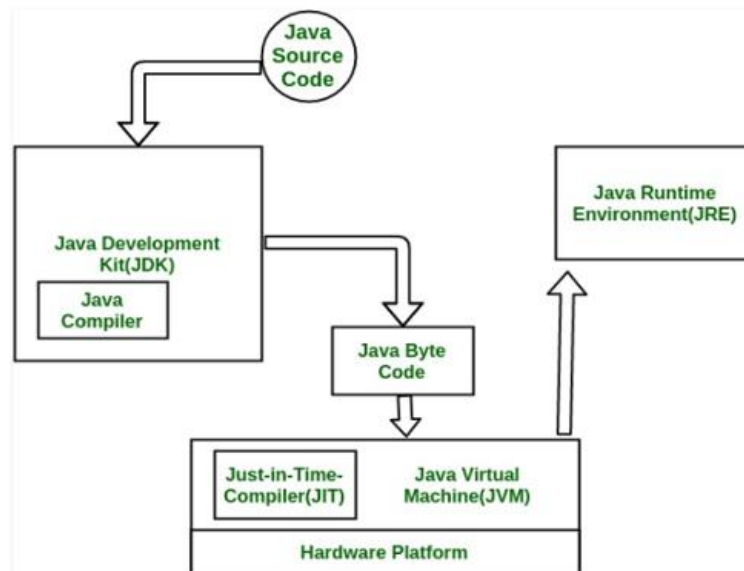

## JAVA RUNTIME ENVIRONMENT

JRE is an acronym for Java Runtime Environment. It is also written as Java RTE. The Java Runtime Environment is a set of software tools which are used for developing Java applications. It is used to provide the runtime environment. It is the implementation of JVM. It physically exists. It contains a set of libraries + other files that JVM uses at runtime.

## JAVA DEVELOPMENT KIT

JDK is an acronym for Java Development Kit. The Java Development Kit (JDK) is a software development environment which is used to develop Java applications and applets. It physically exists. It contains JRE + development tools.

The JDK contains a private Java Virtual Machine (JVM) and a few other resources such as an interpreter/loader (java), a compiler (javac), an archiver (jar), a documentation generator (Javadoc), etc. to complete the development of a Java Application.

		<pre> void area() { area=3.14*r*r; } void display() { System.out.println("Area="+area); }  } } </pre>			
<b>Question</b>	6a	Write a Java program to print sum of n numbers in a 1-D array.	5	CO1	L2
<b>Scheme</b>		Program (5M)	5		
<b>Solution</b>		<pre> class Test {     static int arr[] = { 12, 3, 4, 15 };      // method for sum of elements in an array     static int sum()     {         int sum = 0; // initialize sum         int i;          // Iterate through all elements and add them to sum         for (i = 0; i &lt; arr.length; i++)             sum += arr[i];          return sum;     }      // Driver method     public static void main(String[] args)     {         System.out.println("Sum of given array is "             + sum());     } } </pre>			
<b>Question</b>	6b	Explain the operations of the following operators with example. i) short circuit operators ii) >>>	5	CO1	L2
<b>Scheme</b>		2 operator explanation with program (2*2.5)	2.5+2.5		
<b>Solution</b>		<p>i) In Java logical operators, if the evaluation of a logical expression exits in between before complete evaluation, then it is known as Short-circuit. A short circuit happens because the result is clear even before the complete evaluation of the expression, and the result is returned</p> <p>AND(&amp;&amp;) short circuit: In the case of AND, the expression is evaluated until we get one false result because the result will always be false, independent of the further conditions. If there is an expression</p>			

with &&(logical AND), and the first operand itself is false, then a short circuit occurs, the further expression is not evaluated, and false is returned.

```
import java.io.*;
```

```
class ShortCirAND {  
    public static void main(String arg[])  
    {  
  
        // Since first operand is false  
        // and operator is &&,  
        // Evaluation stops and  
        // false is returned.  
        if (false && true && true)  
        {  
            System.out.println("This output "  
                + "will not "  
                + "be printed");  
        }  
        else  
        {  
  
            System.out.println("This output "  
                + "got printed actually, "  
                + "due to short circuit");  
        }  
  
        // Whole expression will be evaluated,  
        // as no false is encountered  
        // before last condition  
        // Therefore no Short circuit  
  
        if (true && true && true)  
        {  
            System.out.println("This output "  
                + "gets print"  
                + " as there will be"  
                + " no Short circuit");  
        }  
        else  
        {  
  
            System.out.println("This output "  
                + "will not "  
                + "be printed");  
        }  
    }  
}
```

ii) In Java, the operator '>>>' denotes unsigned right shift operator and always fill 0 irrespective of the sign of the number.

```
class GFG {  
  
    // main driver method  
    public static void main(String args[])  
    {  
  
        // x is stored using 32 bit 2's complement form.  
        // Binary representation of -1 is all 1s (111..1)  
        int x = -1;  
  
        // The value of 'x>>>29' is 00...0111  
        System.out.println(x >>> 29);  
  
        // The value of 'x>>>30' is 00...0011  
        System.out.println(x >>> 30);  
  
        // The value of 'x>>>31' is 00...0001  
        System.out.println(x >>> 31);  
    }  
}
```
