Date :	14/12/24	Duration:90 m	Max Marks:	50	Sem:		V	·		OB	E
		An	swer any FIV Question		<u>JLL</u>			Mark	s C	0.0	R B T
1	• Tech	e Significance of nical students migement as it diversales:	ght resist stud	ying	project			10			
	 Example governoad The I ICT. Consequence Poor fundi Project Succession 	nple: In the UK d rnment spent more contracts (£1.4 b Department for W ees of Mismanage management of I ang for essential s cess Rates:	uring 2002-20 re on ICT proj illion). Vork and Pensi ement: CT projects ca ervices like ho standish Group ere successful.	oos, ects oons oons oons oons	(£2.3 billion) than alone spent over £3	on 800 million o			C	05	L3

Cause	s of Project Failures:		
•	Mismanagement is often the root cause.		
•	The National Audit Office in the UK highlighted a 'lack of		
	skills and a proven approach to project management and		
	risk management' as factors contributing to project failures.		
Define	e Project. Explain the characteristics of project.	10	
A proj	ect is a planned activity, according to dictionary definitions.		
The fo	ollowing characteristics distinguish projects:		
*	non-routine tasks are involved;		
*	planning is required;		
*	specific objectives are to be met or a specified product is to be created;		
*	the project has a predetermined time span;		
*	work is carried out for someone other than yourself;		
*	work involves several specialisms;		
*	people are formed into a temporary work group to carry out the task;		
*	work is carried out in several phases;		CO2
*	the resources that are available for use on the project are constrained;		CO3
*	The project is large or complex.		
Projec •	t Size and Difficulty: Larger projects (e.g., 20 developers) are		
	disproportionately more difficult than smaller ones (e.g.,		
	10 developers) due to increased coordination needs.		
•	Examples and exercises in the book focus on smaller projects		
	for ease of understanding, but the discussed techniques are		
	relevant to larger projects as well.		
Nature	e of Projects as Temporary Sub-organizations:		
•	Projects are temporary sub-organizations formed to carry out specific tasks.		

Define Software quality. Explain the quality specification in detail Functional Requirements: Define what the system is to do. Resource Requirements: Specify allowable costs. Quality Requirements: State how well the system is to operate. When there's concern about a specific quality characteristic in a software product, a quality specification should include the following details: Definition/Description Definition: Clear definition of the quality characteristic. Description: Detailed description of what the quality characteristic entails. Scale Unit of Measurement: The unit used to measure the quality characteristic (e.g., faults per thousand lines of code). Test Practical Test: The method or process used to test the extent to which the quality attribute exists. Minimally Acceptable Worst Acceptable Value: The lowest acceptable value, below which the product would be rejected. Target Range Planned Range: The range of values within which it is planned that the quality measurement value should lie. Current Value Now: The value that applies currently to the quality characteristic.	•	This setup can disrupt existing organizational authority but			
 Functional Requirements: Define what the system is to do. Resource Requirements: Specify allowable costs. Quality Requirements: State how well the system is to operate. When there's concern about a specific quality characteristic in a software product, a quality specification should include the following details: Definition/Description Definition: Clear definition of the quality characteristic. Description: Detailed description of what the quality characteristic entails. Scale Unit of Measurement: The unit used to measure the quality characteristic (e.g., faults per thousand lines of code). 3. Test Practical Test: The method or process used to test the extent to which the quality attribute exists. 4. Minimally Acceptable Worst Acceptable Value: The lowest acceptable value, below which the product would be rejected. 5. Target Range Planned Range: The range of values within which it is planned that the quality measurement value should lie. 6. Current Value		allows specialists to focus on a single important task.

 Worst Acceptable Value: The lowest acceptable value, below which the product would be rejected. Target Range Planned Range: The range of values within which it is planned that the quality measurement value should lie. Current Value 		which the quality attribute exists.			
which the product would be rejected. 5. Target Range Planned Range: The range of values within which it is planned that the quality measurement value should lie. 6. Current Value	4.	Minimally Acceptable			
 5. Target Range Planned Range: The range of values within which it is planned that the quality measurement value should lie. 6. Current Value 		 Worst Acceptable Value: The lowest acceptable value, below 			
 Planned Range: The range of values within which it is planned that the quality measurement value should lie. Current Value 		which the product would be rejected.			
planned that the quality measurement value should lie. 6. Current Value	5.	Target Range			
6. Current Value		 Planned Range: The range of values within which it is 			
		planned that the quality measurement value should lie.			
Now: The value that applies currently to the quality characteristic.	6.	Current Value			
		o Now: The value that applies currently to the quality characteristic.			

Explain ISO S	9126'S major external software quality characteristics.	10	
ISO 9126 So	ftware Quality Characteristics		
1. Funct	cionality:		
0	Definition: The functions that a software product provides to		
	satisfy user needs.		
0	Sub-characteristics: Suitability, accuracy,		
	interoperability, security, compliance.		
2. Relia l	bility:		
0	Definition: The capability of the software to maintain		
	its level of performance under stated conditions.		
0	Sub-characteristics: Maturity, fault tolerance, recoverability.		
3. Usabi	lity:		
0	Definition: The effort needed to use the software.		
0	Sub-characteristics: Understandability, learnability,		CO2
	operability, attractiveness.		
4. Effici	ency:		
0	Definition: The ability to use resources in relation to the		
	amount of work done.		
0	Sub-characteristics: Time behavior, resource utilization.		
5. Main	tainability:		
0	Definition: The effort needed to make changes to the software.		
0	Sub-characteristics: Analyzability, modifiability, testability.		
6. Porta	bility:		
0	Definition: The ability of the software to be		
	transferred from one environment to another.		
0	Sub-characteristics: Adaptability, install ability, co-existence.		

Demoi	instrate the different ways of categorizing software project.	10	
1.	Compulsory vs. Voluntary Users		
	o Compulsory Users:		
	 Users must use the system to perform tasks (e.g., recording a sale). 		
	 Easier to elicit precise requirements from users. 		
	o Voluntary Users:		
	 Users choose to use the system (e.g., computer games). 		
	 Difficult to elicit precise requirements. 		
	 Relies on developers' ingenuity, market 		
	surveys, focus groups, and prototype		
	evaluation.		
2.	Information Systems vs. Embedded Systems		
	o Information Systems:		
	 Enable staff to carry out office processes. 		
	 Example: Stock control system. 	co	5
	o Embedded Systems:		
	 Control machines. 		
	 Example: Air conditioning control in a building. 		
	 Hybrid Systems: 		
	 Combine elements of both information and embedded systems. 		
	 Example: Stock control system that also 		
	controls an automated warehouse.		
Outso	ourced Projects		
1.	Commercial Sense of Outsourcing: Companies may		
	outsource parts of a project if they lack expertise or find it		
	cost-effective.		
2.	Project Characteristics: Outsourced projects are typically		
	small and need to be completed within a few months.		
3.	Management Challenges: Managing outsourced		
	projects entails special challenges due to their size		

i	1.1						
	and time constraints.						
4	. Indian Software Co	mpanies : Indian co	mpanies are				
	renowned for executi	ng outsourced softv	ware projects and are				
	beginning to focus or	ı product developm	ent.				
5	. Revenue Impact: Ge	eneric software prod	lucts provide				
	long-term revenue, w	hile outsourced pro	jects offer one-				
	time revenue.						
Obj	ective-Driven Developn	nent					
]	. Project Distinctions	: Projects can aim to	o produce a				
	product or meet certa	in objectives.					
2	2. Client Responsibility	y: In product creation	on, the client justifies the product.				
3	3. Objective-Driven Pr	r ojects : These proje	ects identify solutions				
	to problems, leading	to product recomme	endations.				
4		-					
		Two-Stage Projects : Initial objective-driven stage leads to recommendations, followed by product creation if					
	needed.						
4	5. Technical Work by						
	-	_					
1	noode oro unalgor all	owing for a premin	nary uesign and

Return on investment (ROI)

ROI = Average annual profit X 100
Total investment

In the previous example

· average annual profit

= 50,000/5

= 10,000

• ROI = 10,000/100,000 X 100

= 10%

Discount factor

Discount factor = $1/(1+r)^t$ r is the interest rate

(e.g. 10% is 0.10)

t is the number of years

In the case of 10% rate and one year

Discount factor = 1/(1+0.10)

= 0.9091

In the case of 10% rate and two years Discount factor = $1/(1.10 \times 1.10)$

-0.8294

Applying discount factors

Year	Cash- flow	Discount factor	Discount ed cash flow
0	-100,000	1.0000	-100,000
1	10,000	0.9091	9,091
2	10,000	0.8264	8,264
3	10,000	0.7513	7,513
4	20,000	0.6830	13,660
5	100,000	0.6209	62,090
		NPV	618
