

**Fourth Semester B.E/B.Tech. Degree Examination, June/July 2025**

**Electromagnetics Theory**

Time: 3 hrs.

Max. Marks:100

**Note: 1. Answer any FIVE full questions, choosing ONE full question from each module.**

**2. M : Marks , L: Bloom's level , C: Course outcomes.**

| Module - I |    |                                                                                                                                                                                                                                                                                                                                                              | M | L  | C   |
|------------|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|----|-----|
| 1          | a. | Derive an expression for electric field intensity due to infinite the charge.                                                                                                                                                                                                                                                                                | 8 | L2 | CO1 |
|            | b. | Define Coulomb's law in the vector form and explain.                                                                                                                                                                                                                                                                                                         | 5 | L1 | CO1 |
|            | c. | Transform the vector field $\vec{W} = 10\vec{a}_x - 8\vec{a}_y + 6\vec{a}_z$ to cylindrcal co-ordinate system at point P(10, -8, 6).                                                                                                                                                                                                                         | 7 | L3 | CO1 |
| OR         |    |                                                                                                                                                                                                                                                                                                                                                              |   |    |     |
| 2          | a. | Define position vector and distance vector with an illustration in Cartesian system.                                                                                                                                                                                                                                                                         | 5 | L1 | CO1 |
|            | b. | A change of $1\mu\text{C}$ is at A(2, 0, 0), what charge must be placed at print B(-2, 0, 0), which will make 'y' component of total force per unit charge is zero at point C(1, 2, 2). Assume that the media is free space.                                                                                                                                 | 7 | L3 | CO1 |
|            | c. | Electric charge lies in the plane at $z = -2\text{m}$ in the form of a square sheet described by $-2 \leq x \leq +2\text{m}$ and $-2 \leq y \leq +2\text{m}$ with charge density $P_s$ of $2(x^2 + y^2 + 4)^{3/2} \eta \text{ C/m}^2$ . Determine electric field intensity $\vec{E}$ at the origin.                                                          | 8 | L3 | CO1 |
| Module - 2 |    |                                                                                                                                                                                                                                                                                                                                                              |   |    |     |
| 3          | a. | If $\vec{E} = -8xy\vec{a}_x - 4x^2\vec{a}_y + \vec{a}_z \text{ V/m}$ , the charge of 6C is to be moved from B(1, 8, 5) to A(2, 18, 6). Find the work done. Selected path is $y = 3x^2 + z$ and $Z = x + 4$ .                                                                                                                                                 | 9 | L3 | CO2 |
|            | b. | State and prove Gauss law.                                                                                                                                                                                                                                                                                                                                   | 5 | L2 | CO2 |
|            | c. | Derive the expression for current continuity equation.                                                                                                                                                                                                                                                                                                       | 6 | L2 | CO2 |
| OR         |    |                                                                                                                                                                                                                                                                                                                                                              |   |    |     |
| 4          | a. | Obtain $\vec{E}$ and $\vec{D}$ for infinite sheet of charge using Gauss law.                                                                                                                                                                                                                                                                                 | 8 | L2 | CO2 |
|            | b. | Let $\vec{D} = 5r^2\vec{a}_r \text{ m C/m}^2$ for $r < 0.08\text{m}$ and $\vec{D} = 0.1/r^2\vec{a}_r \text{ m C/m}^2$ for $r > 0.1\text{m}$ , find : i) Volume charge density for $r = 0.06\text{m}$ , ii) Volume charge density for $r = 0.1\text{m}$ . Assume that $\vec{D}$ is in spherical system.                                                       | 6 | L3 | CO2 |
|            | c. | The current density vector is given by $\vec{J} = \frac{2}{r} \cos\theta\vec{a}_r + 20e^{-2r} \sin\theta\vec{a}_\theta$ , find<br>i) $\vec{J}$ at $(r = 3\text{m}, \theta = 0^\circ, \phi = \pi)$<br>ii) Total current passing through the sphere with $r = 3\text{m}$ , $0 \leq \theta \leq 20^\circ$ and $0 \leq \phi \leq 2\pi$ in $\vec{a}_r$ direction. | 6 | L3 | CO2 |
| Module - 3 |    |                                                                                                                                                                                                                                                                                                                                                              |   |    |     |
| 5          | a. | Find $\vec{E}$ at P(3, 1, 2) for the field of two co-axial conducting cylinders with $v = 50\text{V}$ at $r = 2\text{m}$ and $v = 20\text{V}$ at $r = 3\text{m}$ using Laplace's equation.                                                                                                                                                                   | 9 | L3 | CO3 |
|            | b. | Calculate the value of $\vec{J}$ if $\vec{H} = \frac{1}{\sin\theta}\vec{a}_\theta$ at P(2, $30^\circ$ , $20^\circ$ ).                                                                                                                                                                                                                                        | 5 | L3 | CO3 |
|            | c. | Deduced Poisson's and Laplace's equation using Gauss law in point form. Write Laplacian operation on 'V' for different co-ordinate system.                                                                                                                                                                                                                   | 6 | L2 | CO3 |

## OR

|   |    |                                                                                                                                                                                                                                                                                                                                |    |    |     |
|---|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|----|-----|
| 6 | a. | Derive the expression for magnetic field $\vec{H}$ due to infinite long straight line using Biot – Savart law.                                                                                                                                                                                                                 | 10 | L2 | CO3 |
|   | b. | A Co-axial cable with radius of inner conductor 'a', inner radius of outer conductor 'b' and its outer radius 'c'. The outer conductor carries current + I and inner conductor carries current – I. Determine and sketch variation of $\vec{H}$ against 'r' for: i) $r < a$ ii) $a < r < b$ iii) $b < r < c$ and iv) $r > c$ . | 10 | L3 | CO3 |

## Module – 4

|   |    |                                                                                                                                                                                                                   |   |    |     |
|---|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|----|-----|
| 7 | a. | In a certain region, the magnetic flux density in a magnetic material with $X_m = 6$ is given as $\vec{B} = 0.005y^2 \vec{a}_x \text{ T}$ at $y = 0.4 \text{ m}$ , find $\vec{J}$ , $\vec{J}_b$ and $\vec{J}_T$ . | 8 | L3 | CO4 |
|   | b. | Derive Lorentz force equation and explain.                                                                                                                                                                        | 5 | L2 | CO4 |
|   | c. | Derive an equation for the force between the two differential current elements.                                                                                                                                   | 7 | L2 | CO4 |

## OR

|   |    |                                                                                                                                                                     |   |    |     |
|---|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|----|-----|
| 8 | a. | A square loop of wire in $z = 0$ plane carrying 2mA in the field of an infinite filament on the y-axis as shown in the Fig.Q8(a). Find the total force on the loop. | 7 | L3 | CO4 |
|---|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|----|-----|

\*\*\*\*\*

1.a)

Find the electric field intensity due to a line charge distribution of  $\rho_L$  C/m of infinite length where charge is uniformly distributed along the length.

$$\frac{z'}{p} = \tan \theta$$

$$z' = p \tan \theta$$

$\rho_L$  C/m

Find  $\vec{E}$  at  $P(0, y, 0)$  because of the line charge along z-axis.

We consider incremental charge  $dQ = \rho_L dz'$  ... (1) [charge on length  $dz'$ ]

$$\vec{R} = \vec{P} - \vec{z}' \quad (\vec{z}' + \vec{R} = \vec{P})$$

$$\vec{R} = (p\hat{a}_p - z'\hat{a}_z) \quad \dots (2) \quad |\vec{R}| = \sqrt{p^2 + z'^2}$$

$\therefore$  The field at P, because of  $dQ$ ,

$$d\vec{E} = \frac{dQ}{4\pi\epsilon_0 |\vec{R}|^2} \hat{a}_R = \frac{\rho_L dz'}{4\pi\epsilon_0 (p^2 + z'^2)} \cdot \frac{(p\hat{a}_p - z'\hat{a}_z)}{(p^2 + z'^2)}$$

$$\left[ \because |\vec{R}| = \sqrt{p^2 + z'^2} \right]$$

$$= \frac{\rho_L dz' (p\hat{a}_p - z'\hat{a}_z)}{4\pi\epsilon_0 (p^2 + z'^2)^{3/2}}$$

We know from the symmetry of the problem, (3)

$$d\vec{E} = \frac{\rho_L dz' p \hat{a}_p}{4\pi\epsilon_0 (p^2 + z'^2)^{3/2}}$$

∴ The field at P,

$$\vec{E} = \int d\vec{E} = \int_{z'=-\infty}^{\infty} \frac{\rho_L dz' \hat{a}_p}{4\pi\epsilon_0 (r^2 + z'^2)^{3/2}} \hat{a}_p$$

$$= \frac{\rho_L \rho}{4\pi\epsilon_0} \int_{-\infty}^{\infty} \frac{dz'}{(r^2 + z'^2)^{3/2}} \hat{a}_p \quad \left[ \begin{array}{l} \text{note} \\ \tan \theta = \frac{z'}{r} \end{array} \right]$$

$$\begin{array}{l|l} z' = r \tan \theta & z' \rightarrow \infty, \theta = \pi/2 \\ dz' = r \sec^2 \theta d\theta & z' \rightarrow -\infty, \theta = -\pi/2 \end{array}$$

$$\therefore \vec{E} = \frac{\rho_L \rho}{4\pi\epsilon_0} \int_{-\pi/2}^{\pi/2} \frac{r \sec^2 \theta d\theta}{(r^2 + r^2 \tan^2 \theta)^{3/2}} \hat{a}_p$$

$$= \frac{\rho_L \rho}{4\pi\epsilon_0} \int_{-\pi/2}^{\pi/2} \frac{r \sec^2 \theta d\theta}{(r^2)^{3/2} (1 + \tan^2 \theta)^{3/2}} \hat{a}_p$$

$$= \frac{\rho_L \rho}{4\pi\epsilon_0} \int_{-\pi/2}^{\pi/2} \frac{r \sec^2 \theta d\theta}{r^3 (\sec^2 \theta)^{3/2}} \hat{a}_p$$

$$= \frac{\rho_L \rho}{4\pi\epsilon_0} \int_{-\pi/2}^{\pi/2} \frac{\sec^2 \theta d\theta}{\sec^3 \theta} \hat{a}_p = \frac{\rho_L}{4\pi\epsilon_0} \int_{-\pi/2}^{\pi/2} \frac{1}{\sec \theta} d\theta \hat{a}_p$$

$$= \frac{\rho_L}{4\pi\epsilon_0} \int_{-\pi/2}^{\pi/2} \cos \theta d\theta \hat{a}_p = \frac{\rho_L}{4\pi\epsilon_0} [\sin \theta]_{-\pi/2}^{\pi/2} \hat{a}_p$$

$$= \frac{\rho_L}{4\pi\epsilon_0} [1 + 1] \hat{a}_p = \frac{\rho_L}{2\pi\epsilon_0 \rho} \hat{a}_p$$

∴ The electric field intensity due to infinite static line charge along z-axis,

$$\boxed{\vec{E} = \frac{\rho_L}{2\pi\epsilon_0 \rho} \hat{a}_p \text{ V/m}}$$

1.(b)

Soln. The force b/w two very small charged objects separated in vacuum or free space by a distance which is large compared to their size is proportional to the charge on each and inversely proportional to the square of the dist. b/w them.

$$\therefore F = \frac{k Q_1 Q_2}{R^2}$$

$Q_1$  &  $Q_2 \rightarrow$  +ve or -ve quantities of charge  
unit Coulomb (C)

$R \rightarrow$  separation in m.

$k \rightarrow$  constant of proportionality.

$$k = \frac{1}{4\pi\epsilon_0}$$

where,  $\epsilon_0 \rightarrow$  permittivity of free space.

$$\epsilon_0 = 8.854 \times 10^{-12} \text{ F/m}$$

$$= \frac{1}{36\pi} \times 10^{-9} \text{ F/m}$$

$F \rightarrow$  Force in Newton.

$\vec{r}_1 \rightarrow$  locates  $Q_1$

$\vec{r}_2 \rightarrow$  locates  $Q_2$

$Q_1, Q_2$  of same sign,  $F_2$  in the direction as indicated.

$F_2 \rightarrow$  force ~~ex~~ exerted on  $Q_2$  by  $Q_1$ .

$\hat{a}_{12} \rightarrow$  unit vector along  $\vec{R}_{12}$ .

Then, the vector form of Coulomb's law is

$$\vec{F}_2 = \frac{Q_1 Q_2}{4\pi\epsilon_0 R_{12}^2} \hat{a}_{12}$$

$$\text{where, } \hat{a}_{12} = \frac{\vec{R}_{12}}{|\vec{R}_{12}|} = \frac{\vec{r}_2 - \vec{r}_1}{|\vec{r}_2 - \vec{r}_1|}$$

$|\vec{R}_{12}| = R =$  distance b/w the ~~to~~ two charges.

Let,  $\vec{F}_1$  be the force exerted by  $Q_1$  on  $Q_2$ .

$$\vec{r}_1 = \vec{r}_2 + \vec{R}_{21}$$

$$\Rightarrow \vec{R}_{21} = \vec{r}_1 - \vec{r}_2 = -(\vec{r}_2 - \vec{r}_1)$$

$$\therefore \hat{a}_{12} = -\hat{a}_{21}$$

Important observations:

- i) charges should be point charges and stationary in nature.
- ii) should consider the signs of the charges to decide whether the force will be attractive or repulsive.
- iii) Coulomb's law is linear.  
i.e. if  $\vec{F}_2 = -\vec{F}_1$   
then,  $n\vec{F}_2 = -n\vec{F}_1$   
where  $n$  is a scalar.
- iv) Force on a charge in the presence of several other charges is the sum of the forces on that charge due to each of the other charges acting alone.

Solution

$$\textcircled{a} F_p = \vec{F} \cdot \hat{a}_p = (10\hat{a}_x - 8\hat{a}_y + 6\hat{a}_z) \cdot \hat{a}_p \\ = 10 \cos \phi - 8 \sin \phi$$

Now  $P(10, -8, 6)$  is provided in Cartesian co-ordinates

$$\therefore \text{corresponding, } \rho = \sqrt{100+64} = 12.80$$

$$\phi = \tan^{-1}\left(\frac{-8}{10}\right) = -38.65^\circ$$

$$z = 6.$$

$$\therefore F_p = 10 \cos(-38.65) - 8 \sin(-38.65) \\ = 7.809 + 4.9964 = 12.80$$

$$F_q = \vec{F} \cdot \hat{a}_q = (10\hat{a}_x - 8\hat{a}_y + 6\hat{a}_z) \cdot \hat{a}_q \\ = -10 \sin \phi - 8 \cos \phi$$

$$= -10 \sin(-38.65) - 8 \cos(-38.65)$$

$$= 6.24 - 6.24 = 0$$

$$F_z = 6.$$

$$\therefore \vec{F} = 12.80\hat{a}_p + 6\hat{a}_z$$

2.(a)

2.(b)

2.(b)

$$\vec{A} = 2\hat{a}_x$$

$$\vec{B} = -2\hat{a}_y$$

$$\vec{C} = \hat{a}_x + 2\hat{a}_y + 2\hat{a}_z$$

$$\vec{R}_1 = (-\hat{a}_x + 2\hat{a}_y + 2\hat{a}_z)$$

$$\vec{R}_2 = (3\hat{a}_x + 2\hat{a}_y + 2\hat{a}_z)$$

$$\vec{E} = \vec{E}_1 + \vec{E}_2 = \frac{1}{4\pi\epsilon_0} \left\{ \frac{Q_1(-\hat{a}_x + 2\hat{a}_y + 2\hat{a}_z)}{27} + \frac{Q_2(3\hat{a}_x + 2\hat{a}_y + 2\hat{a}_z)}{17\sqrt{17}} \right\}$$

To remove y-component,

$$0 = \frac{1}{4\pi\epsilon_0} \left( \frac{Q_1 \times 2}{27} + \frac{Q_2 \times 2}{17\sqrt{17}} \right)$$

$$\therefore \boxed{Q_2 = -2.6 \mu\text{C}}$$

2.(c)

2.(c)  $\rho_s = 2(x^2 + y^2 + 4)^{3/2} \text{ nC/m}^2$

$dQ = \rho_s ds$  where,  $ds = dxdy$

$\therefore d\vec{E} = 2(x^2 + y^2 + 4)^{3/2} dxdy (-x\hat{a}_x + y\hat{a}_y + 2\hat{a}_z) \times 10^{-9}$

---

$\vec{E} = \frac{4\pi\epsilon_0(x^2 + y^2 + 4)^{3/2}}{\pi\epsilon_0} dxdy \hat{a}_z \times 10^{-9}$

$\therefore \vec{E} = \int d\vec{E} = \int_{y=-2}^2 \int_{x=-2}^2 \frac{1}{\pi\epsilon_0} dxdy \times 10^{-9} \hat{a}_z$

$= 575.21 \hat{a}_z \text{ V/m}$

3.(a)

$$y = 3x^2 + z, \quad z = x + 4, \quad Q = 6 \text{ C}$$

$$\vec{E} = -8xy \hat{a}_x - 4x^2 \hat{a}_y + \hat{a}_z \text{ V/m.}$$

$$B(1, 8, 5) \text{ to } A(2, 18, 6)$$

$$W = -Q \left[ \int_{x=1}^2 -8xy \, dx - \int_{y=8}^{18} 4x^2 \, dy + \int_{z=5}^6 dz \right]$$

$$y = 3x^2 + x + 4, \quad dy = (6x + 1) \, dx$$

$$\therefore W = -Q \left\{ - \int_{x=1}^2 (24x^3 + 8x^2 + 32x) \, dx - \int_{x=1}^2 4x^2 (6x + 1) \, dx + \int_{z=5}^6 dz \right\}$$

$$= 1530 \text{ Joule,}$$

3.(b)

Derive Mathematical form of Gauss's law and explain.  
Gauss's law: The electric flux passing through any closed surface is equal to the total charge enclosed by the surface.

$Ds \rightarrow$  flux density at the surface  
 $\downarrow$   
varies from one point to another on the surface

$\Delta S \rightarrow$  a small portion of the surface.

$\vec{\Delta S} \rightarrow$  mag. and direction  
direction normal at that point -  
outward +ve for any surface.

At any pt. P consider an incremental surface  $\Delta S$ .

$\vec{D}_S$  makes an angle  $\theta$  with  $\vec{\Delta S}$ .

Then flux crossing  $\vec{\Delta S}$  is then,

$$\Delta \phi = \text{flux crossing } \Delta S \\ = \vec{D}_S \cdot \vec{\Delta S}.$$

$\therefore$  Total flux passing through entire closed surface,

$$\phi = \int d\phi = \oint_{\text{closed surface}} \vec{D}_S \cdot d\vec{S} = \text{charge enclosed} = Q$$

This type of closed surface is a Gaussian surface.

The mathematical formulation of Gauss's law,

$$\phi = \oint_S \vec{D}_S \cdot d\vec{S} = \text{charge enclosed} = Q.$$

If ~~several~~ several point charges,

$$Q = \sum Q_n.$$

$$\text{line charge, } Q = \int P_L dl$$

$$\text{surface charge, } Q = \int P_s dA.$$

$$\text{volume charge, } Q = \int_{\text{vol}} P_v dV.$$

last form represents all the other forms

$$\oint \vec{D}_s \cdot d\vec{s} = \int_{\text{vol}} \rho_v d\tau$$

$\underbrace{\quad}_{\text{flux}} \quad \underbrace{\quad}_{\text{charge}}$

~~Proof~~ Verification

~~Verification~~ of Gauss's law:

Sphere of radius  $a$ ,

$$\vec{E} = \frac{Q}{4\pi\epsilon_0 a^2} \hat{a}_r$$

considering point charge at origin of sphere.

$$D = \epsilon_0 E$$

At the surface of the sphere,

$$D = \frac{Q}{4\pi a^2} \hat{a}_r$$

$$ds = r^2 \sin\theta d\theta d\phi = a^2 \sin\theta d\theta d\phi$$

$$\therefore d\vec{s} = a^2 \sin\theta d\theta d\phi \hat{a}_r$$

$$\therefore \vec{D}_s \cdot d\vec{s} = \frac{Q}{4\pi a^2} \sin\theta d\theta d\phi \hat{a}_r \cdot \hat{a}_r$$

$$= \frac{Q}{4\pi} \sin\theta d\theta d\phi$$

$$\therefore \text{Overall surface, } \int \vec{D}_s \cdot d\vec{s} = \frac{Q}{4\pi} \int_0^{2\pi} \int_0^\pi \sin\theta d\theta d\phi$$

$$= \frac{Q}{4\pi} [\cos\theta]_0^\pi \cdot 2\pi$$

$$= \frac{Q}{2} [1 + 1] = Q$$

$\therefore$  Q.C. of electric flux are crossing the surface, as we should, since the enclosed charge is Q.

3.(c)

Continuity of current  $\rightarrow$  Applicable when we are considering closed surface.  
Charges can be neither created nor destroyed.

Equal amounts of +ve and -ve charge may be simultaneously created, ~~and~~ obtained by separate destroyed or lost by recombination.

Current through the closed surface,

$$I = \oint_S \vec{J} \cdot d\vec{s}$$

outward flow of +ve charge balanced by a decrease of +ve charge within the closed surface.

Let,  $Q_i \rightarrow$  be the charge inside the closed surface.

$$\therefore I = \oint_S \vec{J} \cdot d\vec{s} = - \frac{dQ_i}{dt} \rightarrow \text{reduction in charge.}$$

$\therefore$  negative sign

Using Divergence theorem,

$$\oint_S \vec{J} \cdot d\vec{s} = \int_{\text{vol}} (\vec{\nabla} \cdot \vec{J}) dv$$

$$\text{Now, } Q = \int_{\text{vol}} \rho_e dv$$

$$\therefore \int_{\text{vol}} (\vec{\nabla} \cdot \vec{J}) dv = - \frac{d}{dt} \int_{\text{vol}} \rho_e dv$$

If the ~~de~~ surface is constant, derivative becomes a partial derivative.

$$\therefore \int_{\text{vol}} (\vec{\nabla} \cdot \vec{J}) dV = \int_{\text{vol}} - \frac{\partial \rho_e}{\partial t} dV.$$

This expression is true for any volume, however small, it is true for an incremental volume,

$$(\vec{\nabla} \cdot \vec{J}) dV = - \frac{\partial \rho_e}{\partial t} dV.$$

$\therefore$  Point form of continuity equation,

$$\boxed{(\vec{\nabla} \cdot \vec{J}) = - \frac{\partial \rho_e}{\partial t}}$$

4.(a)

# Infinite surface charge

$$Q_{en} = \oint \vec{D} \cdot d\vec{s}$$

$$Q_{en} = \rho_s \cdot A \quad \dots \textcircled{1}$$

where,  $\rho_s$  <sup>C/m<sup>2</sup></sup> surface charge density

$$\begin{aligned} \oint \vec{D} \cdot d\vec{s} &= \iint_{top} D_z \, ds + \iint_{bottom} D_z \, ds \\ &= D_z (A + A) = 2A \cdot D_z \end{aligned}$$

$$\rho_s \cdot A = 2A \cdot D_z$$

$$D_z = \frac{\rho_s}{2}$$

$$\vec{D} = D_z \hat{a}_z = \frac{\rho_s}{2} \hat{a}_z \text{ C/m}^2$$

$$\therefore \vec{E} = \frac{\vec{D}}{\epsilon_0} = \frac{\rho_s}{2\epsilon_0} \hat{a}_z \text{ V/m}$$

4.(b)

① Find charge density at  $r = 0.06 \text{ m}$ .

$$\rho_v = (\nabla \cdot \vec{D}), \quad \vec{D} = 5r^2 \hat{a}_r \text{ mC/m}^2$$

$$\rho_v = \nabla \cdot \vec{D} = \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 D_r)$$

$$= \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \cdot 5r^2) = \frac{1}{r^2} \frac{\partial}{\partial r} (5r^4)$$

$$= \frac{1}{r^2} \cdot 20r^3 = \underline{\underline{20r}}$$

$$\rho_v \Big|_{r=0.06 \text{ m}} = (20 \times 0.06) = 1.20 \text{ mC/m}^3$$

(ii) Find charge density at  $r = 0.1 \text{ m}$ .

$$\vec{D} = \left( \frac{0.1}{r^2} \right) \hat{a}_r \text{ C/m}^2$$

$$\nabla \cdot \vec{D} = \frac{1}{r^2} \left( \frac{\partial}{\partial r} (r^2 D_r) \right)$$

$$= \frac{1}{r^2} \cdot \left( \frac{\partial}{\partial r} \cdot \left( r^2 \cdot \frac{0.1}{r^2} \right) \right)$$

$$= 0$$

$$\vec{D} = D_r \hat{a}_r$$

$$+ D_\theta \hat{a}_\theta$$

$$+ D_\phi \hat{a}_\phi$$

4.(c)  $\vec{J} = \frac{2}{\lambda} \cos\theta \hat{a}_\lambda + 20e^{-2\lambda} \sin\theta \hat{a}_\theta$

(a)  $\vec{J} = \frac{2}{3} \cos(0) \hat{a}_\lambda + 20e^{-2(3)} \sin(0) \hat{a}_\theta$   
 $= \frac{2}{3} \hat{a}_\lambda = 0.666 \hat{a}_\lambda$

$I = \oint \vec{J} \cdot d\vec{s} = \iint \frac{2}{\lambda} \cos\theta \cdot \lambda^2 \sin\theta d\theta d\phi$   
 $= \iint \lambda \sin 2\theta d\theta d\phi$

at  $\lambda = 3\text{m}$ ,  $I = 2.204\text{A}$ .

5.(a)

Find  $|\vec{E}|$  at  $P(2,1,2)$  for the field of two coaxial conducting cylinders placed along  $z$ -axis.  
 $V = 50\text{V}$  at  $\rho = 2\text{m}$  and  $V = 20\text{V}$  at  $\rho = 3\text{m}$ .

Ans. Variation w.r.t  $\rho$  only.

$\therefore \frac{1}{\rho} \frac{\partial}{\partial \rho} \left( \rho \frac{\partial V}{\partial \rho} \right) = 0$   
 $\Rightarrow \frac{\partial}{\partial \rho} \left( \rho \frac{\partial V}{\partial \rho} \right) = 0$   
 $\Rightarrow \rho \frac{\partial V}{\partial \rho} = A$   
 $\Rightarrow \partial V = \frac{A \partial \rho}{\rho}$   
 $\Rightarrow V = A \ln \rho + B$

$V = 50$  at  $\rho = 2 \Rightarrow 50 = A \ln 2 + B$   
 $V = 20$  at  $\rho = 3 \Rightarrow 20 = A \ln 3 + B$

---

$30 = A \ln \left( \frac{2}{3} \right)$   
 $\Rightarrow 30 = -40.5 A$   
 $\Rightarrow A = -73.98$

$\therefore 50 = -73.98 \ln 2 + B$   
 $\Rightarrow B = 50 + 73.98 \ln 2 = 101.279$

$\therefore V = -73.98 \ln \rho + 101.279$

$\therefore \vec{E} = -\vec{\nabla} V = -\frac{\partial V}{\partial \rho} \hat{a}_\rho = + \frac{73.98}{\rho} \hat{a}_\rho$

Here,  $\rho = \sqrt{2^2 + 1^2} = \sqrt{5}$

$\therefore |\vec{E}| = \frac{73.98}{\sqrt{5}} = 23.39\text{V/m}$

5. (b)

5. (b)  $\vec{J} = \vec{\nabla} \times \vec{H}$

$\vec{H} = \frac{1}{\sin\theta} \hat{a}_\theta$

$\therefore \vec{J} = \vec{\nabla} \times \vec{H} = \frac{1}{r^2 \sin\theta} \begin{bmatrix} \hat{a}_r & r \hat{a}_\theta & r \sin\theta \hat{a}_\phi \\ \frac{\partial}{\partial r} & \frac{\partial}{\partial \theta} & \frac{\partial}{\partial \phi} \\ H_r & r H_\theta & r \sin\theta H_\phi \end{bmatrix}$

$= \frac{1}{r^2 \sin\theta} \begin{bmatrix} \hat{a}_r & r \hat{a}_\theta & r \sin\theta \hat{a}_\phi \\ \frac{\partial}{\partial r} & \frac{\partial}{\partial \theta} & \frac{\partial}{\partial \phi} \\ 0 & \frac{r}{\sin\theta} & 0 \end{bmatrix}$

$= \frac{1}{r^2} \cdot \frac{r \sin\theta}{\sin\theta} \hat{a}_\phi \cdot \frac{1}{\sin\theta} = \frac{1}{r} \frac{\hat{a}_\phi}{\sin\theta}$

$\therefore$  at  $P(2, 30^\circ, 20^\circ)$ ,  $\boxed{\vec{J} = 0.25 \hat{a}_\phi}$

5. (c)

Derive Poisson's and Laplace's equation

$$\vec{\nabla} \cdot \vec{D} = \rho_v \quad \dots (1)$$

$$\vec{D} = \epsilon_0 \vec{E} \quad \dots (2)$$

$$\vec{E} = -\vec{\nabla} V \quad \dots (3)$$

$$\vec{\nabla} \cdot \vec{D} = \vec{\nabla} \cdot (\epsilon_0 \vec{E}) = \epsilon_0 (\vec{\nabla} \cdot \vec{E}) = \rho_v$$

$$\text{or } \epsilon_0 (\vec{\nabla} \cdot (-\vec{\nabla} V)) = \rho_v$$

$$\text{or } -\epsilon_0 \vec{\nabla} \cdot (\vec{\nabla} V) = \rho_v \quad \dots (4)$$

$$\cancel{\vec{\nabla} \cdot (\vec{\nabla} V)} \quad \vec{\nabla} \cdot (\vec{\nabla} V)$$

$$= \left( \hat{a}_x \frac{\partial}{\partial x} + \hat{a}_y \frac{\partial}{\partial y} + \hat{a}_z \frac{\partial}{\partial z} \right) \cdot \left( \frac{\partial V}{\partial x} \hat{a}_x + \frac{\partial V}{\partial y} \hat{a}_y + \frac{\partial V}{\partial z} \hat{a}_z \right)$$

$$= \frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} + \frac{\partial^2 V}{\partial z^2}$$

$$= \nabla^2 V$$

∴ eqn. (4) reduces to,

$$\epsilon_0 \nabla^2 V = -\rho_v$$

$$\text{or } \boxed{\nabla^2 V = -\frac{\rho_v}{\epsilon_0}} \rightarrow \text{Poisson's equation.}$$

$$\text{Now if } \rho_v = 0 \rightarrow \boxed{\nabla^2 V = 0} \rightarrow \text{Laplace's eqn.}$$

→ zero volume charge density, but allowing point charges, line charge and surface density to exist at singular locations as sources of the field.

$\nabla^2 V \rightarrow$  Laplacian of  $V$ .

In rectangular co-ordinate system,

$$\nabla^2 V = \frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} + \frac{\partial^2 V}{\partial z^2}$$

In cylindrical co-ordinates,

$$\nabla^2 V = \frac{1}{\rho} \frac{\partial}{\partial \rho} \left( \rho \frac{\partial V}{\partial \rho} \right) + \frac{1}{\rho^2} \frac{\partial^2 V}{\partial \phi^2} + \frac{\partial^2 V}{\partial z^2}$$

In spherical co-ordinates,

$$\nabla^2 V = \frac{1}{r^2} \frac{\partial}{\partial r} \left( r^2 \frac{\partial V}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial V}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 V}{\partial \phi^2}$$

## 6.a) Magnetic field intensity due to infinite long conductor using Biot Savart Law:

Differential current element

Biot-Savart law:

At any point \$P\$, magnitude of magnetic field intensity produced by the differential element is proportional to the product of current, the magnitude of differential length and the sine of the angle lying between the filament and the line connecting the filament to the point \$P\$ at which the field is desired;

Also the magnitude of the magnetic field intensity is inversely proportional to the square of the distance from the differential element to the point \$P\$.

The direction of the magnetic field intensity is normal to the plane containing the filament and the line drawn from the filament to the point \$P\$.

$$d\vec{H} = \frac{I d\vec{L} \times \vec{R}}{4\pi |\vec{R}|^3}$$

$$\boxed{d\vec{H} = \frac{I d\vec{L} \times \vec{R}}{4\pi |\vec{R}|^3}} \quad A/m$$

Current element at point 1 & point at which field is determined at point 2.

$$d\vec{H}_2 = \frac{I d\vec{L}_1 \times \vec{R}_{12}}{4\pi |\vec{R}_{12}|^3}$$

$$\boxed{d\vec{H}_2 = \frac{I d\vec{L}_1 \times \vec{R}_{12}}{4\pi |\vec{R}_{12}|^3}} \quad A/m$$

Infinitely long straight filament:

$$d\vec{L} = dz \vec{a}_z$$

$$\vec{H} = \int_L \frac{\Sigma d\vec{L} \times \vec{a}_P}{4\pi |\vec{R}|^3}$$

$$\vec{H} = \int_L \frac{\Sigma d\vec{L} \times \vec{R}}{4\pi |\vec{R}|^3}$$

Cylindrical

$$\vec{H} \times \vec{A} = \frac{1}{r} \begin{vmatrix} \vec{a}_r & \vec{a}_\phi & \vec{a}_z \\ \frac{\partial}{\partial r} & \frac{\partial}{\partial \phi} & \frac{\partial}{\partial z} \\ A_\rho & \rho A_\phi & A_z \end{vmatrix}$$

Spherical

$$\vec{H} \times \vec{A} = \frac{1}{r^2 \sin \theta} \begin{vmatrix} \vec{a}_r & r \vec{a}_\theta & r \sin \theta \vec{a}_\phi \\ \frac{\partial}{\partial r} & \frac{\partial}{\partial \theta} & \frac{\partial}{\partial \phi} \\ A_r & r A_\theta & r \sin \theta A_\phi \end{vmatrix}$$

$$d\vec{L} \times \vec{R} = \frac{1}{r} \begin{vmatrix} \vec{a}_r & \rho \vec{a}_\phi & \vec{a}_z \\ 0 & 0 & dz \\ r & 0 & -z \end{vmatrix}$$

$$= \frac{1}{r} \left[ -\rho \vec{a}_\phi (0 - \rho dz) \right]$$

$$= \frac{\rho^2}{r} dz \vec{a}_\phi$$

$$\boxed{d\vec{L} \times \vec{R} = \rho dz \vec{a}_\phi}$$

$$\vec{H} = \int_{-\infty}^{\infty} \frac{\Sigma \rho dz \vec{a}_\phi}{4\pi (r^2 + z^2)^{3/2}}$$

$$\tan d = \frac{z}{\rho}$$

$$z = \rho \tan d$$

$$dz = \rho \sec^2 d \, dd$$

|     |            |            |
|-----|------------|------------|
| $z$ | $z_1$      | $z_2$      |
| $d$ | $\alpha_1$ | $\alpha_2$ |

$$\vec{H} = \frac{\Sigma}{4\pi} \int_{\alpha_1}^{\alpha_2} \frac{\rho^2 \sec^2 d \, dd \, \vec{a}_\phi}{\left[ \rho^2 + \rho^2 \tan^2 d \right]^{3/2}}$$

$$= \frac{\Sigma}{4\pi} \int_{\alpha_1}^{\alpha_2} \frac{\rho^2 \sec^2 d \, dd \, \vec{a}_\phi}{(\rho^2 \sec^2 d)^{3/2}}$$

$$= \frac{\Sigma}{4\pi \rho} \int_{\alpha_1}^{\alpha_2} \cos d \, dd \, \vec{a}_\phi$$

$$\boxed{\vec{H} = \frac{\Sigma}{4\pi \rho} \left[ \sin \alpha_2 - \sin \alpha_1 \right] \vec{a}_\phi} \quad A/m$$

Finite conductors

$$\alpha_1 \rightarrow -\pi/2 \quad \text{and} \quad \alpha_2 \rightarrow \pi/2$$

$$\vec{H} = \frac{\Sigma}{4\pi \rho} [1 - (-1)] \vec{a}_\phi$$

$$\boxed{\vec{H} = \frac{\Sigma}{2\pi \rho} \vec{a}_\phi} \quad A/m$$

Infinite conductor

6.b) H due to coaxial cable:

② Infinitely long coaxial transmission line

carrying total current  $I$  in center conductor &  
 $-I$  in outer conductor

$H \rightarrow$  does not vary with  $z$  or  $\phi$  due to symmetry.

Radial symmetry  
 $\downarrow$   
 all components cancel.

only  $H_\phi$  component which varies with  $\rho$ .

$H_\phi(\rho)$

$\rho = \rho_1, \phi = \phi_1$   
 $\rho = \rho_1, \phi = \phi_1$   
 $H_\phi$  only.

(i)  $a < \rho < b$  larger than  $a$ , smaller than  $b$

$I_{enc} = I$

$\int \vec{H} \cdot d\vec{c} = I$

$\int_0^{2\pi} H_\phi \rho d\phi = I$

$H_\phi = \frac{I}{2\pi\rho}$ ;  $a < \rho < b$

(ii)  $\rho < a$  smaller than  $a$

$I_{enc} = \frac{\eta \rho^2}{\pi a^2} \cdot I$

$\eta \rho^2 \rightarrow I$

$\eta \rho^2 \rightarrow ? I_{enc}$

$I_{enc} = \frac{\rho^2 I}{a^2}$

$\int_0^{2\pi} H_\phi \rho d\phi = \frac{\rho^2 I}{a^2}$

$2\pi \rho H_\phi = \frac{\rho^2 I}{a^2}$

$H_\phi = \frac{I \rho}{2\pi a^2}$ ;  $\rho < a$

(iii)  $\rho > c$  larger than  $c$

$I_{enc} = I + (-I)$

$I_{enc} = 0$

$H_\phi = 0$ ;  $\rho > c$

(iv)  $b < \rho < c$

$$\pi(c^2 - b^2) \rightarrow -I$$

$$\pi(\rho^2 - b^2) \rightarrow I_x = ? \quad I_x = \frac{\pi(\rho^2 - b^2)}{\pi(c^2 - b^2)}$$

$$I_{enc} = I - I_x$$

$$I_{enc} = I - \frac{I(\rho^2 - b^2)}{(c^2 - b^2)}$$

$$2\pi\rho H_\phi = I - \frac{I(\rho^2 - b^2)}{(c^2 - b^2)}$$

$$H_\phi = \frac{I}{2\pi\rho} \left[ \frac{c^2 - b^2 - \rho^2 + b^2}{c^2 - b^2} \right]$$

$$H_\phi = \frac{I}{2\pi\rho} \left[ \frac{c^2 - \rho^2}{c^2 - b^2} \right] ; b < \rho < c$$

Magnetic field strength variation with radius  
for coaxial cable with  $b=3a$ ,  
 $c=4a$ .

$H$  is continuous at all conductor boundaries.

The value of  $H_\phi$  shows no sudden jumps.

External field is zero.

7.a) Problem:

$$7) a) \vec{B} = 0.005y^2 \hat{a}_x \text{ T at } y = 0.4 \text{ m}$$

$$\gamma_m = 68$$

$$\mu_0 = 4\pi \times 10^{-7}$$

$$\vec{H} = \frac{\vec{B}}{\mu} = \frac{\vec{B}}{\mu_0(1+\gamma_m)}$$

$$\vec{J} = \frac{1}{\mu_0(1+\gamma_m)} (\nabla \times \vec{B})$$

$$1) \vec{J} = \nabla \times \vec{H}$$

$$\nabla \times \vec{B} = \begin{vmatrix} \hat{a}_x & \hat{a}_y & \hat{a}_z \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 0.005y^2 & 0 & 0 \end{vmatrix} = -0.01y \hat{a}_z$$

$$\text{At } y = 0.4 \text{ m}$$

$$\therefore \vec{J} = -154.72 \hat{a}_z \text{ A/m}^2$$

$$2) \vec{J}_b = \nabla \times \gamma_m \vec{B} = \frac{\gamma_m}{\mu_0(1+\gamma_m)} \left[ \vec{J} - 2728.37 \hat{a}_z \right] \text{ A/m}^2$$

$$3) \vec{J}_f = \frac{\nabla \times \vec{B}}{\mu_0} = \frac{1}{\mu_0} \left[ \vec{J} - 3183.09 \hat{a}_z \right] \text{ A/m}^2$$

## 7.b) Lorentz force equation:

Force on a moving charge:

Electric force on a charged particle,

$$\vec{F} = q\vec{E} \rightarrow (1)$$

same den as  $\vec{E}$  for a positive charge.

If the charge is in motion, the above equation gives the force at any point in its trajectory.

Force on a charged particle is in motion in a magnetic field of flux density,  $\vec{B}$

$$\vec{F} = q\vec{v} \times \vec{B} \rightarrow (2)$$

direction of force is  $\perp$  to both  $\vec{v}$  and  $\vec{B}$

$\vec{F}$  applied  $\perp$  to the den in which charge is moving.

can never change its velocity.

Acceleration vector is always normal to velocity vector

kinetic energy of particle remains unchanged.

Steady magnetic field is incapable of transferring energy to a moving charge

Electric field  $\rightarrow$  exerts force on particle which is independent of the den of progressing charge

$\&$  effects an energy transfer between field and particle is general.

Force on a moving particle arising from combined electric & magnetic field.

(by superposition)

$$\vec{F} = q(\vec{E} + \vec{v} \times \vec{B}) \rightarrow (3)$$

Lorentz force equation

Solution is required in determining

- 1) electron orbits in magnetron
- 2) proton paths in cyclotron
- 3) plasma characteristics in a magnetohydrodynamic (MHD) generator.

In general charged particle motion is combined electric and magnetic fields

### 7.c) Force between two differential current elements:

Consider two current elements, to find force b/w two current elements

W.K.T: Magnetic field at point 2 due to current element at point 1.

$$dH_2^{\rightarrow} = \frac{I_1 dL_1^{\rightarrow} \times a_{R12}^{\rightarrow}}{4\pi |R_{12}^{\rightarrow}|^2}$$

Differential force on a differential current element

$$dF^{\rightarrow} = I dL^{\rightarrow} \times B^{\rightarrow}$$

Differential Flux density ( $dB_2^{\rightarrow}$ ) at point 2 caused by current element 1 ( $I dL_1^{\rightarrow}$ )

Differential amount of <sup>differential</sup> force on element 2,

$$d(dF_2^{\rightarrow}) = I_2 dL_2^{\rightarrow} \times dB_2^{\rightarrow}$$

where

$$dB_2^{\rightarrow} = \mu_0 dH_2^{\rightarrow} = \frac{\mu_0 I_1 dL_1^{\rightarrow} \times a_{R12}^{\rightarrow}}{4\pi |R_{12}^{\rightarrow}|^2}$$

$$\therefore d(dF_2^{\rightarrow}) = \mu_0 \frac{I_1 I_2}{4\pi |R_{12}^{\rightarrow}|^2} \cdot dL_2^{\rightarrow} \times (dL_1^{\rightarrow} \times a_{R12}^{\rightarrow}) \rightarrow (13)$$

$d(dF_1^{\rightarrow}) \neq d(dF_2^{\rightarrow})$  because of the nonphysical nature of the current element.

From the differential force, we can get

Total force between two filamentary circuits

$$\vec{F}_2 = \frac{\mu_0 I_1 I_2}{4\pi} \oint \left[ dL_2^{\rightarrow} \times \oint \frac{dL_1^{\rightarrow} \times a_{R12}^{\rightarrow}}{|R_{12}^{\rightarrow}|^2} \right]$$

$$\vec{F}_2 = \frac{\mu_0 I_1 I_2}{4\pi} \oint \left[ \oint \frac{a_{R12}^{\rightarrow} \times dL_1^{\rightarrow}}{|R_{12}^{\rightarrow}|^2} \right] \times dL_2^{\rightarrow}$$

8.a) Problem:

Magnetic field due to infinite current element along y-axis

$$\vec{H} = \frac{I}{2\pi x} \vec{a}_2 \quad \boxed{\vec{H} = \frac{15}{2\pi x} \vec{a}_2} \text{ A/m}$$

$\therefore$  Flux density  $\vec{B} = \mu_0 \vec{H} = 4\pi \times 10^{-7} \times 15 \frac{\vec{a}_2}{2\pi x}$

$$\boxed{\vec{B} = \frac{3 \times 10^{-6}}{x} \vec{a}_2} \text{ T}$$

Force on the loop,

$$\boxed{\vec{F} = -I \oint_L \vec{B} \times d\vec{L}}$$

Total force = sum of the forces on four sides

(124)

$$\vec{F} = -2 \times 10^{-3} \left[ \oint_L \vec{B} \times d\vec{L} \right]$$

$$= -2 \times 10^{-3} \times 3 \times 10^{-6} \left[ \int_{x=1}^3 \frac{\vec{a}_2}{x} \times dx \vec{a}_x + \int_{x=3}^1 \frac{\vec{a}_2}{x} \times dy \vec{a}_y \right]_{x=3}$$

$$+ \int_{x=1}^3 \frac{\vec{a}_2}{x} \times dz \vec{a}_z + \int_{x=3}^1 \frac{\vec{a}_2}{x} \times dy \vec{a}_y \Big|_{x=1}$$

$$= -2 \times 10^{-3} \times 3 \times 10^{-6} \left[ -\vec{a}_x \left( \frac{1}{3} \right) (2-0) - \vec{a}_x \left( \frac{1}{1} \right) (0-2) \right]$$

$$= -2 \times 10^{-3} \times 3 \times 10^{-6} \times \frac{4}{3} \vec{a}_x$$

$$\boxed{\vec{F} = -8 \vec{a}_x} \text{ n N} \rightarrow \text{The net force on the loop is in } -\vec{a}_x \text{ direction}$$

### 8.b) Magnetic boundary conditions:

Magnetic boundary conditions:

$\vec{B}_1 = \vec{B}_{t1} + \vec{B}_{N1}$   
 $\vec{B}_2 = \vec{B}_{t2} + \vec{B}_{N2}$   
 $\vec{B} = \mu \vec{H}$   
 $\vec{M} = \gamma_m \vec{H}$   
 $\vec{H}_1 = \vec{H}_{t1} + \vec{H}_{N1}$   
 $\vec{H}_2 = \vec{H}_{t2} + \vec{H}_{N2}$

① Gauss's law for magnetic fields:

$$\phi = \oint_S \vec{B} \cdot d\vec{s} = 0$$

$$\Rightarrow \int_{\text{top}} + \int_{\text{bottom}} + \int_{\text{latem}} \vec{B} \cdot d\vec{s} = 0$$

$$\Rightarrow B_{N1} \cdot \Delta s - B_{N2} \cdot \Delta s + B_{t1} \frac{\Delta h}{2} 2\pi r + B_{t2} \frac{\Delta h}{2} 2\pi r = 0$$

We are obtaining conditions at the boundary,  
 $\therefore \Delta h \rightarrow 0$ .

$$B_{N1} \cdot \Delta s - B_{N2} \cdot \Delta s = 0$$

$$\boxed{B_{N1} = B_{N2}} \Rightarrow \mu_1 H_{N1} = \mu_2 H_{N2}$$

$$\Rightarrow \boxed{H_{N1} = \frac{\mu_2}{\mu_1} H_{N2}}$$

$$\frac{M_{N1}}{\gamma_{m1}} = \frac{\mu_2}{\mu_1} \frac{M_{N2}}{\gamma_{m2}} \Rightarrow \boxed{M_{N1} = \frac{\gamma_{m1}}{\gamma_{m2}} \cdot \frac{\mu_2}{\mu_1} M_{N2}}$$

② Ampere's Circuital Law:

$$\oint_L \vec{H} \cdot d\vec{L} = I_{enc}$$

$$\int_{14} + \int_{4b} + \int_{b2} + \int_{32} + \int_{2a} + \int_{a1} \vec{H} \cdot d\vec{L} = K \cdot \Delta L$$

$$H_{t1} \cdot \Delta L + (-H_{N1} \frac{\Delta h}{2}) + (-H_{N2} \frac{\Delta h}{2}) - H_{t2} \Delta L + H_{N2} \frac{\Delta h}{2} + H_{t1} \frac{\Delta h}{2} = K \cdot \Delta L$$

At the boundary  $\Delta h \rightarrow 0$

$$(H_{t1} - H_{t2}) \cdot \Delta L = K \cdot \Delta L$$

$$\boxed{H_{t1} - H_{t2} = K}$$

$\Downarrow$

$\Rightarrow$

$$\boxed{\frac{B_{t1}}{\mu_1} - \frac{B_{t2}}{\mu_2} = K}$$

$$\frac{M_{t1}}{\gamma_{m1}} - \frac{M_{t2}}{\gamma_{m2}} = K$$

$\Rightarrow$

$$\boxed{M_{t2} = \frac{M_{t1}}{\gamma_{m1}} \cdot \gamma_{m2} - K \gamma_{m2}}$$

The directions are specified more exactly by using the cross product to identify the tangential components,

$$(\mathbf{H}_1 - \mathbf{H}_2) \times \mathbf{a}_{N12} = \mathbf{K}$$

where  $\mathbf{a}_{N12}$  is the unit normal at the boundary directed from region 1 to region 2. An equivalent formulation in terms of the vector tangential components may be more convenient for  $\mathbf{H}$ :

$$\mathbf{H}_{t1} - \mathbf{H}_{t2} = \mathbf{a}_{N12} \times \mathbf{K}$$

8.c) Compare electric and magnetic circuits:

Electric Circuit

Magnetic Circuit

(Electric circuit)

$$\vec{E} = -\vec{\nabla} V$$

$$V_{a,b} = -\int_a^b \vec{E} \cdot d\vec{L}$$

$$\vec{D} = \epsilon \vec{E}, \quad \vec{J} = \sigma \vec{E}$$

$$I = \int_S \vec{J} \cdot d\vec{s}$$

Resistance

$$V = I R$$

Conductance

$$G = \frac{1}{R}$$

$$R = \frac{l}{\sigma S}$$

$$\vec{H} = -\vec{\nabla} V_m$$

$$V_{m,a,b} = \int_a^b \vec{H} \cdot d\vec{L}$$

$$\vec{B} = \mu \vec{H}$$

$$\phi = \int_S \vec{B} \cdot d\vec{s}$$

Reluctance

$$V_m = \phi R$$

Permeance

$$\mathcal{P} = \frac{1}{R}$$

$$R = \frac{l}{\mu S}$$

### 9.a) Inconsistency of current continuity equation and Modified Ampere's law:

Point form of Ampere's circuital law for steady magnetic fields

$$\boxed{\nabla \times \vec{H} = \vec{J}} \quad \leftarrow \text{inadequate for time varying conditions.}$$

Taking divergence,

$$\nabla \cdot \nabla \times \vec{H} = \nabla \cdot \vec{J} = 0.$$

But from continuity equation

$$\boxed{\nabla \cdot \vec{J} = -\frac{\partial \rho_v}{\partial t} \neq 0} \quad \text{for time varying conditions}$$

Suppose we add unknown  $\vec{G}$  to ①

$$\Rightarrow \boxed{\nabla \times \vec{H} = \vec{J} + \vec{G}}$$

Taking divergence,

$$\nabla \cdot \nabla \times \vec{H} = \nabla \cdot \vec{J} + \nabla \cdot \vec{G}$$

$$0 = \nabla \cdot \vec{J} + \nabla \cdot \vec{G}$$

$$\Rightarrow \boxed{\nabla \cdot \vec{G} = \frac{\partial \rho_v}{\partial t}}$$

$$\nabla \cdot \vec{G} = \frac{\partial \nabla \cdot \vec{D}}{\partial t}$$

$$\text{w.k.t} \quad \nabla \cdot \vec{D} = \rho_v$$

The solution for  $\vec{G}$  is obtained as

$$\vec{G} = \frac{\partial \vec{D}}{\partial t}$$

∴ Ampere's circuital law in point form.

$$\nabla \times \vec{H} = \vec{J} + \frac{\partial \vec{D}}{\partial t} \quad (\text{X})$$

$\frac{\partial \vec{D}}{\partial t}$  → has the dimensions of current density,  $A/m^2$ .

↑  
it results from time varying displacement flux density  
Maxwell framed it as displacement current density

$$\nabla \times \vec{H} = \vec{J} + \vec{J}_d$$

$$\vec{J}_d = \frac{\partial \vec{D}}{\partial t}$$

We have already met other two current densities

Conduction current density (motion of charge in the region of zero net charge density)

$$\vec{J} = \sigma \vec{E}$$

Convection current density

$$\vec{J} = \rho_v \vec{v}$$

(motion of volume charge density)

In a non conducting medium, where  $\rho_v = 0 \Rightarrow \vec{J} = 0$ ,

$$\nabla \times \vec{H} = \frac{\partial \vec{D}}{\partial t} \quad \text{if } \vec{J} = 0$$

Total displacement current crossing any given surface,

$$I_d = \int_S \vec{J}_d \cdot d\vec{s} = \int_S \frac{\partial \vec{D}}{\partial t} \cdot d\vec{s}$$

A.C.L for time varying conditions:

$$\int_S (\nabla \times \vec{H}) \cdot d\vec{s} = \int_S \vec{J} \cdot d\vec{s} + \int_S \frac{\partial \vec{D}}{\partial t} \cdot d\vec{s}$$

Apply Stokes' theorem

$$\oint \vec{H} \cdot d\vec{L} = I + I_d = I + \int_S \frac{\partial \vec{D}}{\partial t} \cdot d\vec{s}$$

9.b) General wave equation:

General wave equation (for the media considered)  
of UPW

Maxwell's equations:

|                                                                                               |               |                                                                                                               |
|-----------------------------------------------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------|
| $\vec{\nabla} \cdot \vec{D} = 0$                                                              | $\Rightarrow$ | $\vec{\nabla} \cdot \vec{E} = 0 \rightarrow (1)$                                                              |
| $\vec{\nabla} \times \vec{E} = -\mu \frac{\partial \vec{H}}{\partial t}$                      | $\Rightarrow$ | $\vec{\nabla} \times \vec{E} = -\mu \frac{\partial \vec{H}}{\partial t} \rightarrow (2)$                      |
| $\vec{\nabla} \cdot \vec{B} = 0$                                                              | $\Rightarrow$ | $\vec{\nabla} \cdot \vec{H} = 0 \rightarrow (3)$                                                              |
| $\vec{\nabla} \times \vec{H} = \sigma \vec{E} + \epsilon \frac{\partial \vec{E}}{\partial t}$ | $\Rightarrow$ | $\vec{\nabla} \times \vec{H} = \sigma \vec{E} + \epsilon \frac{\partial \vec{E}}{\partial t} \rightarrow (4)$ |

Take curl on both sides of (2)

$$\vec{\nabla} \times \vec{\nabla} \times \vec{E} = -\vec{\nabla} \times \left( \mu \frac{\partial \vec{H}}{\partial t} \right)$$

Vector identity  $\vec{\nabla} \times \vec{\nabla} \times \vec{E} = \vec{\nabla}(\vec{\nabla} \cdot \vec{E}) - \nabla^2 \vec{E}$

$$\vec{\nabla}(\vec{\nabla} \cdot \vec{E}) - \nabla^2 \vec{E} = -\mu \frac{\partial}{\partial t} (\vec{\nabla} \times \vec{H})$$

Apply equation (1) Apply equation (4)

$$-\nabla^2 \vec{E} = -\mu \frac{\partial}{\partial t} \left[ \sigma \vec{E} + \epsilon \frac{\partial \vec{E}}{\partial t} \right]$$

$$-\nabla^2 \vec{E} = -\mu \sigma \frac{\partial \vec{E}}{\partial t} - \mu \epsilon \frac{\partial^2 \vec{E}}{\partial t^2}$$

$$\nabla^2 \vec{E} = \mu \sigma \frac{\partial \vec{E}}{\partial t} + \mu \epsilon \frac{\partial^2 \vec{E}}{\partial t^2}$$

$$\boxed{\frac{\partial^2 \vec{E}}{\partial z^2} = \mu \sigma \frac{\partial \vec{E}}{\partial t} + \mu \epsilon \frac{\partial^2 \vec{E}}{\partial t^2}} \rightarrow \text{General wave equation for } \vec{E} \text{ field of UPW.}$$

For UPW  
 $\vec{E}(z,t)$  and  
 $\vec{H}(z,t)$   
 $\nabla^2 \vec{E} = \frac{\partial^2 \vec{E}}{\partial z^2}$

Similarly,

Take curl on both sides of (4)

$$\vec{\nabla} \times \vec{\nabla} \times \vec{H} = \vec{\nabla} \times \left( \sigma \vec{E} + \epsilon \frac{\partial \vec{E}}{\partial t} \right)$$

$$\vec{\nabla} (\vec{\nabla} \cdot \vec{H}) - \nabla^2 \vec{H} = \sigma (\vec{\nabla} \times \vec{E}) + \epsilon \frac{\partial (\vec{\nabla} \times \vec{E})}{\partial t}$$

applying equation (3)      applying equation (2)

$$-\nabla^2 \vec{H} = -\sigma \mu \frac{\partial \vec{H}}{\partial t} - \epsilon \mu \frac{\partial^2 \vec{H}}{\partial t^2}$$

$$\boxed{\nabla^2 \vec{H} = \mu \sigma \frac{\partial \vec{H}}{\partial t} + \mu \epsilon \frac{\partial^2 \vec{H}}{\partial t^2}}$$

and  $\vec{H}(z, t)$

$$\nabla^2 \vec{H} = \frac{\partial^2 \vec{H}}{\partial z^2}$$

$$\boxed{\frac{\partial^2 \vec{H}}{\partial z^2} = \mu \sigma \frac{\partial \vec{H}}{\partial t} + \mu \epsilon \frac{\partial^2 \vec{H}}{\partial t^2}} \Rightarrow \text{General wave equation for } \vec{H} \text{ field of UPW.}$$

Similar equations can be written for **D** and **B**

9.c) Problem:

9.c) Problem:

$\vec{B} = 0.2 \sin 10^3 t \hat{a}_z \text{ T}$

$R = 5 \Omega$

$d\vec{s} = \rho d\rho d\phi \hat{a}_z$

$\vec{B} \cdot d\vec{s} = 0.2 \sin 10^3 t \rho d\rho d\phi$

$\phi = \int_0^{\pi} \int_0^{0.1} \vec{B} \cdot d\vec{s} = \int_0^{\pi} \int_0^{0.1} 0.2 \sin 10^3 t \rho d\rho d\phi$

$\phi = 6.283 \sin 10^3 t \text{ mWb}$

$\text{emf} = -\frac{d\phi}{dt} = -6.283 \cos 10^3 t$

$i = \frac{\text{emf}}{R} = \frac{-6.283 \cos 10^3 t}{5} = -1.256 \cos 10^3 t \text{ A}$

$\boxed{i = -1.256 \cos 10^3 t \text{ A}}$

10.a) Maxwell's equations for static fields:

Static Fields:

✖

Four Equations

List the Maxwell's Equations in Integral form and differential (point) form:

10.b) Problem:

10) b)

$f = 9375 \text{ MHz}$

$E_x = 20 \text{ V/m}$

$\mu_r = 1$

$\epsilon_r = 2.56$

$\mu = \mu_0 \mu_r = 4\pi \times 10^{-7} \times 1$

$\epsilon = \epsilon_0 \epsilon_r = 8.854 \times 10^{-12} \times 2.56$

$\omega = 2\pi f$

1)  $\alpha = 0$

2)  $\beta = \omega \sqrt{\mu_0 \mu_r \epsilon_0 \epsilon_r} = 314.37 \text{ rad/m}$

3)  $\lambda = \frac{2\pi}{\beta} = 0.0199 \text{ m}$

4)  $v = f\lambda = 1.873 \times 10^8 \text{ m/s}$

5)  $\eta = \sqrt{\frac{\mu}{\epsilon}} = 235.45 \Omega$

6)  $\gamma = \alpha + j\beta = j 314.37 \text{ /m}$

7)  $H_y = \frac{E_x}{\eta} = \frac{20}{235.45} = 0.08495 \text{ A/m}$

# 10.c) Poynting's theorem:

## Poynting's theorem and Wave Power:

Poynting's theorem states that the net power flowing out of a given volume is equal to the time rate of decrease in stored energy within the volume minus conduction losses ( Ohmic losses)

## Proof:

Maxwell's Equations:

$$\vec{\nabla} \times \vec{E} = -\mu \frac{\partial \vec{H}}{\partial t} \rightarrow (1) \quad \vec{\nabla} \times \vec{H} = \sigma \vec{E} + \epsilon \frac{\partial \vec{E}}{\partial t} \rightarrow (2) \quad \vec{\nabla} \cdot \vec{E} = \frac{\rho_v}{\epsilon} \rightarrow (3) \quad \vec{\nabla} \cdot \vec{H} = 0 \rightarrow (4)$$

Vector Identity:

$$\vec{\nabla} \cdot (\vec{E} \times \vec{H}) = \vec{H} \cdot (\vec{\nabla} \times \vec{E}) - \vec{E} \cdot (\vec{\nabla} \times \vec{H})$$

From (1)

From (2)

$$\vec{\nabla} \cdot (\vec{E} \times \vec{H}) = \vec{H} \cdot \left( -\mu \frac{\partial \vec{H}}{\partial t} \right) - \vec{E} \cdot \left( \sigma \vec{E} + \epsilon \frac{\partial \vec{E}}{\partial t} \right)$$

$$\vec{\nabla} \cdot (\vec{E} \times \vec{H}) = -\mu \vec{H} \cdot \frac{\partial \vec{H}}{\partial t} - \sigma \vec{E} \cdot \vec{E} - \epsilon \vec{E} \cdot \frac{\partial \vec{E}}{\partial t}$$

We can also write,  $\frac{\partial |\vec{H}|^2}{\partial t} = 2 \vec{H} \cdot \frac{\partial \vec{H}}{\partial t}$  ;  $\frac{\partial |\vec{E}|^2}{\partial t} = 2 \vec{E} \cdot \frac{\partial \vec{E}}{\partial t}$  Using these expressions, the above equation can be written as follows.

$$\vec{\nabla} \cdot (\vec{E} \times \vec{H}) = -\mu \frac{1}{2} \frac{\partial H^2}{\partial t} - \sigma E^2 - \epsilon \frac{1}{2} \frac{\partial E^2}{\partial t}$$

$$\vec{\nabla} \cdot (\vec{E} \times \vec{H}) = -\frac{\partial}{\partial t} \left( \frac{1}{2} \mu H^2 + \frac{1}{2} \epsilon E^2 \right) - \sigma E^2$$

**Differential form or Point form of Poynting's theorem**

Integrating the above expression over the given volume "V" as depicted in the figure, provides the Integral form of Poynting's theorem.

$$\iiint_V \vec{\nabla} \cdot (\vec{E} \times \vec{H}) dV = -\frac{d}{dt} \left[ \iiint_V \left( \frac{1}{2} \mu H^2 + \frac{1}{2} \epsilon E^2 \right) dV \right] - \iiint_V \sigma E^2 dV$$

Using Divergence Theorem for the L.H.S.,

$$\iiint_V \vec{\nabla} \cdot \vec{D} dV = \oint_S \vec{D} \cdot \vec{dS}$$

L.H.S. can be written as follows:

$$\iiint_V \vec{\nabla} \cdot (\vec{E} \times \vec{H}) dV = \oint_S (\vec{E} \times \vec{H}) \cdot \vec{dS}$$

$$\oint_S (\vec{E} \times \vec{H}) \cdot \vec{dS} = -\frac{d}{dt} \left[ \frac{1}{2} \iiint_V \mu H^2 dV + \frac{1}{2} \iiint_V \epsilon E^2 dV \right] - \iiint_V \sigma E^2 dV$$

**Integral form of Poynting's theorem**

Net power flowing out of the given Volume "V"

Rate of decrease in stored energy within the Volume "V"

Conduction losses or Ohmic Losses

**Poynting's theorem and Wave Power:**

Poynting's theorem states that the net power flowing out of a given volume is equal to the time rate of decrease in stored energy within the volume minus conduction losses ( Ohmic losses)

Power of an EM wave,

$$P = \oint_S (\vec{E} \times \vec{H}) \cdot \vec{dS} \text{ W}$$

**Power Density vector = Poynting's Vector (Power per unit Area)**

(\*)

$$\vec{S} = \vec{P} = \vec{E} \times \vec{H} \text{ (W/m}^2\text{)}$$

Instantaneous Power Density Vector,  $\vec{P} = \vec{E} \times \vec{H} \text{ W/m}^2$

Active Power Density Vector or Real Power Density Vector,  $\vec{P}_{avg} = \vec{P}_{real} = \frac{1}{2} \text{Re} \{ \vec{E} \times \vec{H}^* \} \text{ W/m}^2$

Reactive Power Density Vector,  $\vec{P}_{reactive} = \frac{1}{2} \text{Im} \{ \vec{E} \times \vec{H}^* \} \text{ W/m}^2$

Instantaneous Power Density = Real Power Density + Reactive Power Density

**Using Phasor Forms:**

$$\langle S \rangle = \frac{1}{2} \text{Re} \{ \vec{E}_s \times \vec{H}_s^* \} \text{ W/m}^2$$
