	Answer any FIVE FULL Questions	MARKS	CO	RBT
1	Define NLP. List and explain applications of NLP.	[10]	CO1	L2
2	Consider the following corpus of three sentences There is a big garden. Children play in a garden. They play inside beautiful garden. Calculate the probability P for the sentence “They play in a big garden” assuming a grammar language model.	[10]	CO1	L3
3	Explain Minimum Edit Distance algorithm. Compute minimum edit distance between “Tutor” and “Tumor”.	[10]	CO2	L3
4	Derive a top down and bottom up parse tree for the given sentence “The angry bear chased the frightened little squirrel” Use the following grammar rule to create the parse tree S -> NP VP Det -> the NP -> Det Nom Adj -> little/angry/frightened VP -> V NP N -> Squirrel/bear Nom -> adj N V -> chased	[10]	CO2	L3
5	Explain design features of IR with a neat diagram.	[10]	CO4	L2
6	Explain WordNet with its applications.	[10]	CO4	L2

IAT Solution

i) NLP - Natural Language Processing:

- NLP is a field of AI and Computational linguistics that concerned with the development of a model for processing natural human language.
- It enables computers to interpret, understand and process the human language.
- The main aims of nlp are:
 - Develop automated tools for natural language processing.
 - Understanding the concept of how human acquire, store, and process the lexical memory (language).
- Applications of NLP:

i) Machine Translation:

- Used to convert text from one language into another.
(Ex: Google Translate)

ii) Speech Identification:

- Used to convert speech into text form.
- Ex: Siri, Alexa etc.

iii) Speech synthesis :

- Used to convert ~~speech~~ the text to human readable speech.
- Ex: Screen Recorder

iv) Natural Language Interface to databases :

- Database querying in natural or simple english sentences
- Ex: Show Student from 7th Sem

v) Data ~~Base~~ Information Retrieval (IR) :

- Retrieves the relevant information or documents.

vi) Information Extraction :

- Extracts the structured facts (names, data, relation) from unstructured information.

2) Given Sentences :

<s> There is a big garden. </s>

<s> Children play in a garden. </s>

<s> They play inside beautiful garden. </s>

Test sentence :

They play in a big garden.

Probability using Bi-gram Model:

$$P(\text{They play in a big garden}) = P(\text{They} | <s>) \times P(\text{play} | \text{They}) \\ \times P(\text{in} | \text{play}) \times P(a | \text{in}) \\ \times P(\text{big} | a) \times P(\text{garden} | \text{big})$$

$$= \frac{1}{3} \times \frac{1}{1} \times \frac{1}{2} \times \frac{1}{1} \times \frac{1}{2} \times \frac{1}{1}$$

$$= \frac{1}{3} \times 1 \times \frac{1}{2} \times 1 \times \frac{1}{2} \times 1$$

$$= \frac{1}{3} \times \frac{1}{2} \times \frac{1}{2}$$

$$= 0.33 \times 0.5 \times 0.5$$

$$= 0.0825$$

$$\therefore P(\text{They play in a big garden}) = 0.0825$$

3) Minimum Edit Distance Algorithm:

The minimum edit distance algorithm states that the minimum edit distance between two strings is the minimum required operations to convert one string into another.

Operations Allowed:

- Insertion (add a letter)
- Deletion (remove a letter)
- Substitution (replace a letter with another)

• Algorithm:

Input: Two strings x and y

Output: minimum edit distance b/w x and y

$m \leftarrow \text{length}(x)$

$n \leftarrow \text{length}(y)$

for $i=0$ to m do

$\text{dist}[i,0] = i$

for $j=0$ to n do

$\text{dist}[0,j] = j$

for $i=0$ to m do

 for $j=0$ to n do

$\text{dist}[i,j] = \min \{ \text{dist}[i-1,j] + \text{insert_cost},$
 $\text{dist}[i-1,j-1] + \text{subst_cost}[x_i, y_j],$
 $\text{dist}[i,j-1] + \text{del_cost} \}$

• The distance is calculated using:

$\text{dist}[i,j] = \min \{ \text{dist}[i-1,j] + \text{insert_cost},$
 $\text{dist}[i-1,j-1] + \text{subst_cost}[x_i, y_j],$
 $\text{dist}[i,j-1] + \text{del_cost} \}$

• Example:

Tutor Vs Tutor

	#	T	U	m	O	n
#	0	1	2	3	4	5
T	1	0	1	2	3	4
U	2	1	0	1	2	3
t	3	2	1	1	2	3
O	4	3	2	2	1	2
n	5	4	3	3	2	①

→ minimum edit distance

∴ The minimum edit distance b/w "Tutor" & "Turner" = 1,

Tutor → replace 't' with 'm' → Turner

4) Top down & Bottom up parse Tree

Sentence : "The angry bear chased the frightened little squirrel"

Grammar :

$S \rightarrow NP + VP$

Det → the

$NP \rightarrow Det + Nom$

Adj → little / angry / frightened

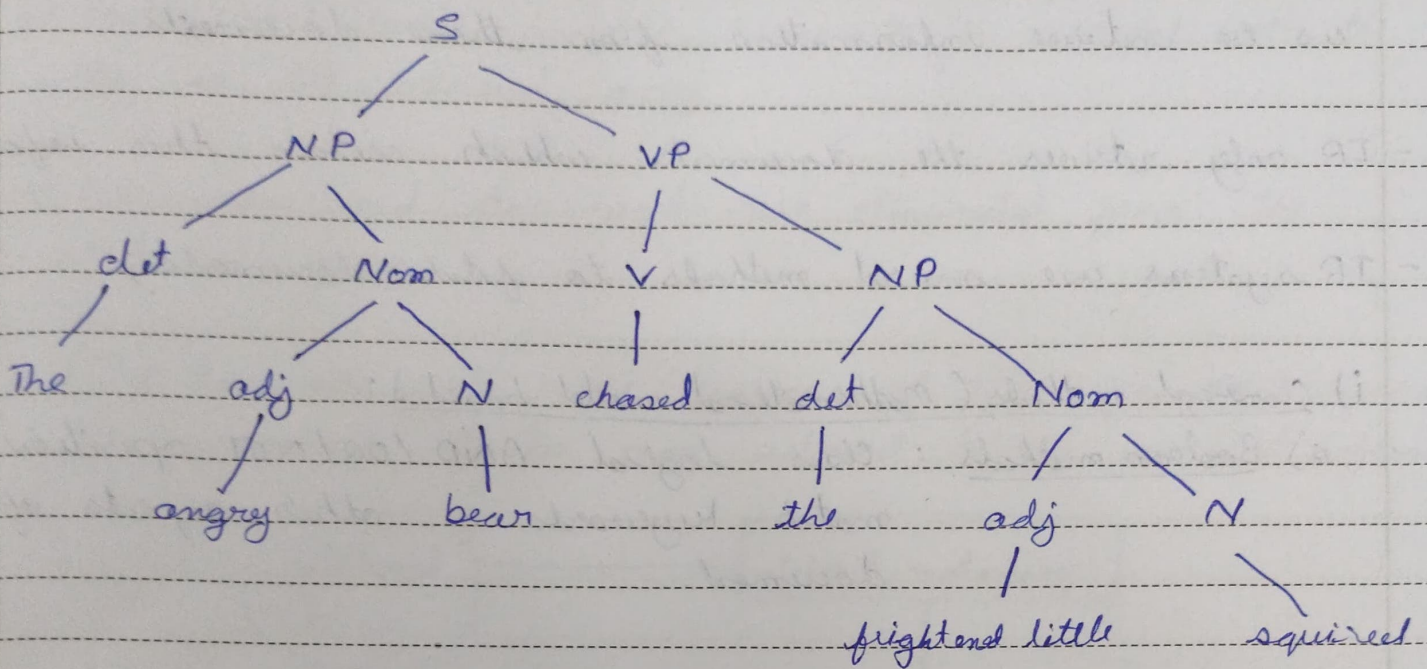

$VP \rightarrow V + NP$

N → squirrel / bear

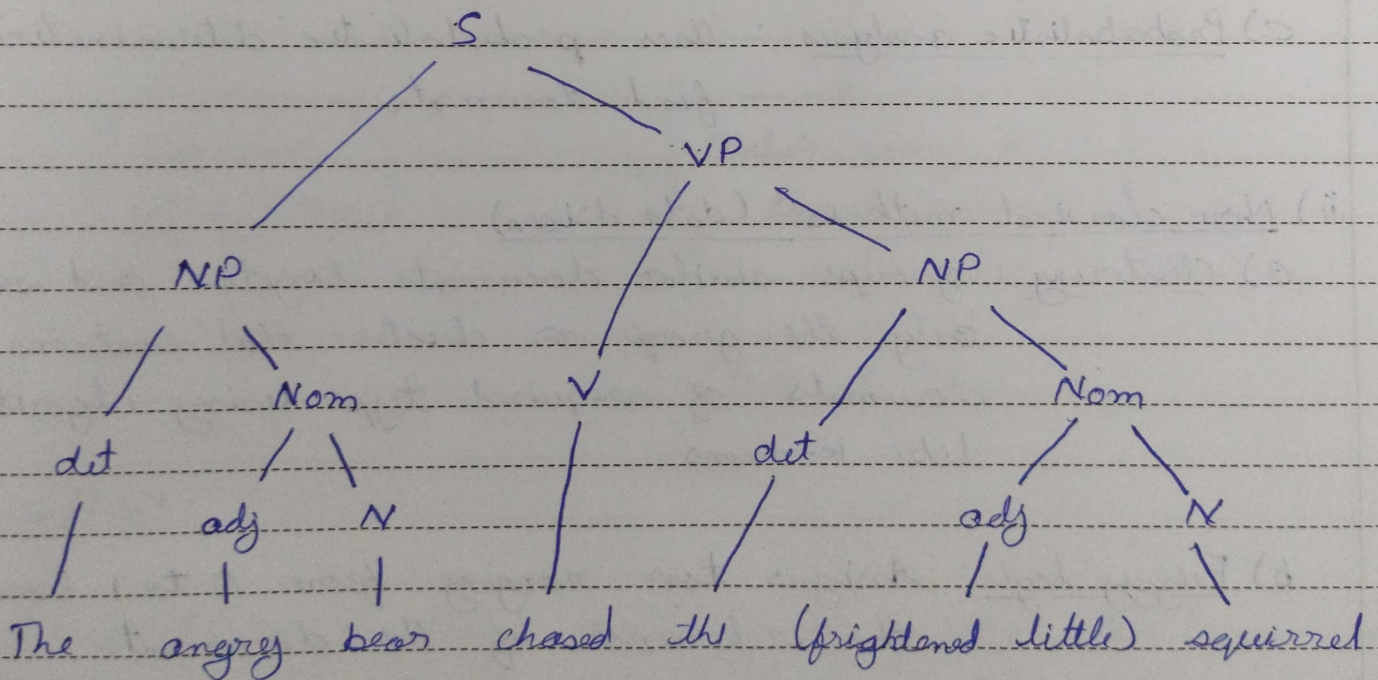

$Nom \rightarrow adj + N$

V → chased

i) Top down parse tree (starts with $S \rightarrow NP + VP$)

ii) Bottom up parse tree (starts at adj → little / angry / frightened)

5) Design features of IR systems:

- IR stands for information retrieval system.
- Given a database or library of documents, IR allows

as to retrieve information from those documents

- IR only retrieves the documents which contain this information.
- IR systems use several methods to fetch documents;

i) Classical methods (mathematical model based):

a) Boolean methods: Uses logical AND/OR/NOT operations to match keywords or other aspects of the document.

b) Vector space analysis: creates a vector space of the documents and the retrieval information.

c) Probabilistic analysis: Uses probabilistic determination to find documents.

ii) Non-classical methods (data driven)

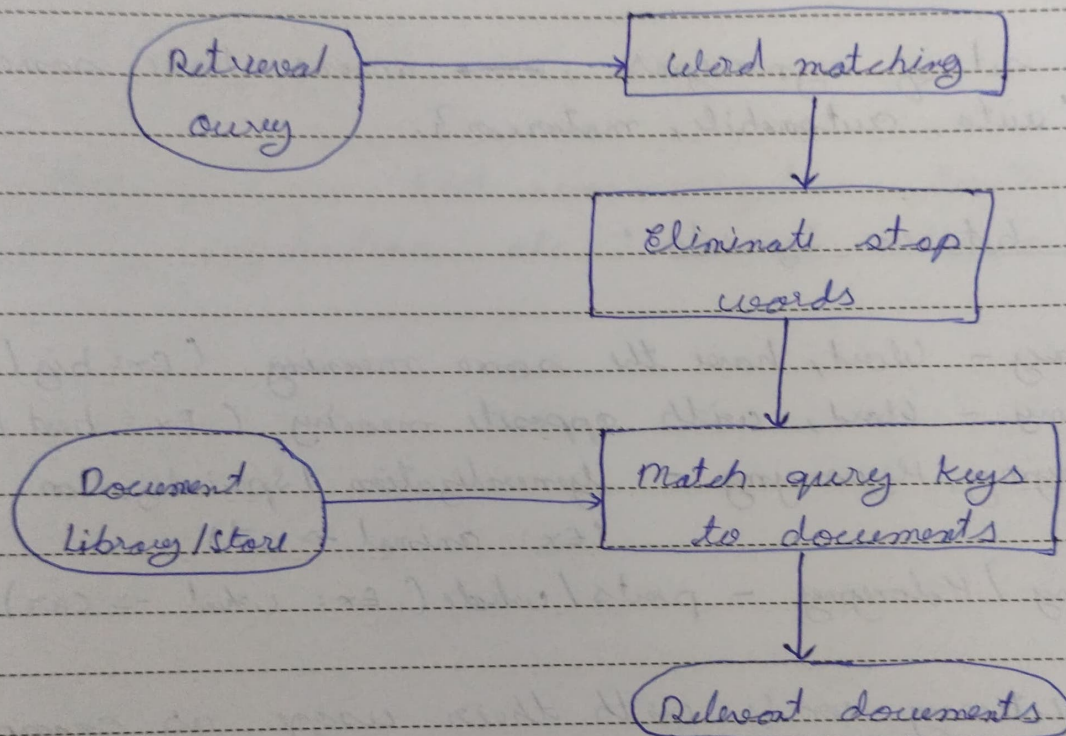

a) Clustering: groups similar documents together and searches only the group or cluster that contains the documents of required type using algorithms like k-means.

b) Fuzzy logic: Assigns tags ranging from 0 to 1 based on the relevance of the document.

- Design Features

i) IR systems contain a word-key matching to find relevance of the documents to the retrieval requirements.

- ii) Each word co-occur in the document is matched with the key in the retrieval query.
- iii) Determiners and stop words are eliminated from the retrieval query.
- iv) The documents with more occurrences of the information's keywords are assumed to be more relevant to the required information.

6) WordNet:

- WordNet is a large database of English, developed and maintained by at the Cognitive Science Laboratory, Princeton University, under, George A. Miller.
- It is inspired by psycholinguistic theories of human lexical memory.

• It groups words as a set of synonyms known as "synsets".

• Each group represent a distinct meaning.

Key Concepts:

• Synsets:

- It is a set of synonyms, ~~mean~~ means have same meaning.
- Ex: {auto, automobile, motorcar}.

• Relation between Synsets:

- Synonymy - Words, have the same meaning (Ex: big / huge)
- Antonymy - Word, with opposite meaning (Ex: heat / cold)
- Hypernymy / Hyponymy - Generalization / Specialization (Ex: animal → cat)
- Meronymy / Holonymy - parts / whole (Ex: wheel → car)

• Gloss: Dictionary words with their usage as example.

Example:
 run (verb) - move fast on foot
 run (verb) - run inches / apart
 run (noun) - a series of operations

• Applications of WordNet:

i) Word Sense Disambiguation (WSD):

- It gives / finds the correct meaning of the words using context.

ii) Concept Identification:

- Identifies concept related to a word from the document, not only the meaning of the words.

iii) Query Expansion in IR:

- Facilitates expansion of queries for better search results.

iv) NLP Applications:

- Semantic analysis, text summarization, Question answering, ontology applications etc.
